

# COMOS Modularized Engineering

From customer request to plant delivery

## Goal

“Shorten the timeline from engineering to fabrication, in order to optimize time to market and to be more competitive”

## Challenges

Competitive and precise offers to customers

Inefficient usability of standards

High quality in documentation in a shorter time frame

## Today

- Various software tools over all disciplines and phases
- Using previous project data to create sales or project documentation by copying
- Mistakes are copied unnoticeably
- Manual processes to synchronize interdisciplinary data
- Information must be re-entered manually several times across the value chain especially during a change e.g. customer demand!
