The GEAFOL Neo: A true GEAFOL and more

Let's be clear right from the start: As a further development of the proven GEAFOL Basic, the GEAFOL Neo represents an evolution, not a revolution. It's based on more than 50 years of proven GEAFOL technology and quality, but it also offers numerous innovations that have allowed us to provide it with several very special characteristics. Its design takes into account several requirements for special applications that we wouldn't have dared dream of when the original GEAFOL was being developed.

As a result, for example, the GEAFOL Neo distribution transformer with a maximum rated power of 4 MVA is almost ten percent lighter than a comparable model from the proven GEAFOL series. And this "slimming down" also has a positive effect on the dimensions.

Universal use

The highest safety requirements must be met whenever distribution transformers are operated in the direct vicinity of humans.

GEAFOL Neo distribution transformers are the perfect solution in this case, because their proven GEAFOL design is coupled with proven operational reliability and a long service life. What's more, they've got the seal of approval because all GEAFOL Neo distribution transformers meet the specifications of VDE 0532-76-11/IEC 60076-11/ DIN EN 60076-11. Other standards, such as GOST, SABS, or CSA/ANSI/ IEEE, can also be taken into account on request. Our GEAFOL transformers are always tested by UL/CSA/TÜV as well. They meet the highest requirements for safe installation in residential and work environments with Climatic Class C2, Environmental Class E2/E3, and Fire Classification F1.

Optimal combination

Keeping the distance between the distribution transformer and consumers as short as possible considerably reduces both the complexity of the electrical network and losses in the transmission and distribution of energy. Frequently, however, there is a shortage of space in the vicinity of the consumer.

The GEAFOL Neo distribution transformer represents an optimal combination of performance, safety, and small dimensions. In addition, the high degree of standardization ensures the best possible cost-benefit ratio. Thanks to their compact shape and comprehensive safety certification, GEAFOL Neo distribution transformers can be used in almost every environment.

Further development of proven technology

With well over 120,000 transformers in use worldwide, essential parts of the GEAFOL technology have already proven themselves over the long term. These include the strip winding and foil winding made from aluminum, which we adopted without change for the new GEAFOL Neo in order to ensure reliability and a long service life. For this purpose, the mechanical construction and high-voltage windings were redesigned to make them lighter and smaller for a truly clean solution. As a result, it was possible to considerably improve heat dissipation. With fewer horizontal surfaces, less dust is deposited, which leads to a further reduction in the already minimal time and effort needed for maintenance and also increases operational reliability.

GEAFOL celebrated its 50-year anniversary in 2016. In honor of the occasion, it underwent an extensive facelift and further optimization. Just one look at the new design tells you: GEAFOL technology is future-proof and innovative.

Maximum efficiency in use and economical, resource-saving production: the new GEAFOL Neo.

Thanks to its technical characteristics, the GEAFOL Neo is well suited to a large number of applications. And you don't have to take the limitations of classic transformer technology into account when planning. Use in a load center allows optimum network designs to be realized – with corresponding advantages in terms of cost and efficiency.

In addition, the GEAFOL Neo makes it possible to dispense with special safety precautions, such as coolant collecting troughs. And with its small dimensions, the GEAFOL Neo permits more power to be installed in the same space. On request, GEAFOL Neo transformers can also be designed for converter loads and specific mechanical stresses (GEAFOL Neo).

Everything that's needed for the future

The GEAFOL Neo is also setting new standards when it comes to being prepared for the future. Even though the end of its service life is still a long way off, the GEAFOL Neo already has the perfect answer to the question of recycling. All metal parts as well as the cast resin can be recycled in an environmentally friendly way.

EU guidelines: Ecodesign Directive of the European Commission

Since July 1, 2015, transformers that are installed within the European Economic Area (EEA) must meet the ecodesign requirements of the new directive, provided that they fall within the scope of the directive.

Because the directive is a measure to implement Ecodesign Directive 209/125/EC, the CE mark is used as evidence of compliance. GEAFOL Neo transformers are designed accordingly and are particularly low-loss and economical. The transformers fulfill standard DIN EN 50588-1.

In addition, the GEAFOL Neo can already be configured in accordance with stage two of the Ecodesign Directive, which sets even stricter minimum standards for energy efficiency and must be implemented by July 1, 2021.

GEAFOL Neo – the intelligent further development of an excellent technology.

Regardless of the application: The GEAFOL Neo's low weight, small dimensions, and high operational reliability with the lowest possible maintenance make it the first choice.

Built-in safety

The coils of the GEAFOL Neo's high-voltage winding are manufactured from aluminum foil. This foil winding combines simple winding techniques with high electrical safety, because its insulation is subject to less electrical stress than other types of windings. In the case of a conventional round-wire winding, the turn-to-turn voltages amount to double the voltage between layers. In the case of a foil winding, however, no more than the simple turn-to-turn voltage occurs because each layer consists of one turn. The result is great power frequency voltage strength and impulse strength. In addition, the epoxy-resin vacuum casting of the high-voltage windings is performed at a high temperature, which avoids hazardous entrapped gas and allows for a high level of freedom from partial discharges up to twice the rated voltage. A high level of process expertise guarantees excellent product quality as reflected in, among other things, an excellent MTBF (meantime between failure) Index.

Reliable design

The conductive material for the low-voltage strip winding is also made of aluminum, with the width of the aluminum strip practically equivalent to the length of the coil in order to considerably reduce the axial short-circuit forces in the transformer. It's these characteristics that make the design of the GEAFOL Neo possible. The conductive and insulating materials are bonded to each other by heat treatment and form a compact unit that also reliably handles radial forces. The ends of the windings are encapsulated in resin.

Using vacuum switches with GEAFOL transformers

Transformers are the key operating elements at hubs in the distribution system. Switches must control the switching of distribution transformers reliably and safely, with no need for overvoltage protection.

An important parameter in transformers is the magnetization current, one of the "small inductive currents." Interrupting these currents naturally creates marked transients but no unacceptably high switching overvoltages that would pose a threat to connected distribution transformers are permitted.

Extensive trials using a combination of Siemens GEAFOL transformers and vacuum switches have proven that the GEAFOL medium-voltage windings can handle switching overvoltages with no difficulty – providing further proof of their high product quality and operational safety.

The GEAFOL Neo – overview of features and advantages

- Innovative clean design
- Power range up to 4 MVA and voltages up to 36 kV (medium-voltage) or 1000 V (low-voltage)
- Variants available for converter operation (on request)
- Mechanically reinforced designs available (on request)
- Up to approx. 10% lower weight
- Up to approx. 40% increase in power possible through forced-air cooling
- Proven GEAFOL technology and quality
- Optimal combination between size and power
- Certified in accordance with VDE 0532/IEC 60076-11/DIN EN 60076-11
- Loss-optimized designs taking into account Ecodesign Directive 2009/125/EC for installation within the European Economic Area
- Climatic Class C2, Environmental Class E2/E3, and Fire Classification F1
- Maintenance-free windings embedded in moisture-proof, fire-resistant, self-extinguishing insulating material that is suitable for the tropics
- High electrical safety thanks to foil winding
- HV winding free of partial discharges (< ambient noise level) up to twice the rated voltage

Construction and features

A new design for your success –
the reliable, space-saving GEAFOL Neo

1. **Three-limb core** made of grain-oriented, low-loss electric sheet steel insulated on both sides
2. **Low-voltage winding** made of aluminum strip; turns are permanently bonded with insulating sheet (Prepreg)
3. **High-voltage winding** made of individual aluminum coils using foil technology and vacuum casting
4. **Lifting eyes integrated into the upper core frame for simple transport**
5. **Delta connection tubes with HV terminals**
6. **Clamping frame and truck**
   Convertible rollers for longitudinal and transverse travel
7. **Insulation made of an epoxy-resin/ quartz powder mixture** makes the transformer extensively maintenance-free, moisture-proof and suitable for the tropics, fire-resistant, and self-extinguishing
8. **High-voltage tappings ± 2 x 2.5% (on the HV terminal side) to adapt to the particular network conditions; reconnectable in de-energized condition**

Temperature monitoring with PTC thermistor detector in the low-voltage windings (alternatively: Pt100 sensors)

Painting of steel parts
High-build coating, RAL 7016, on request: special two-component coating for particularly aggressive environments

Structure made of individual components
For example, windings can be individually assembled and replaced on site

Climatic Class C2

Environmental class E2/E3

Fire classification F1

All GEAFOL Neo transformers comply with DIN VDE 0532-76-11/DIN EN 60076-11/IEC 60076-11/DIN EN 50588-1.
Power ratings > 2500 kVA, different voltages and designs as well as special equipment on request.
1) Dimension drawing: page 10, indications are approximate values.

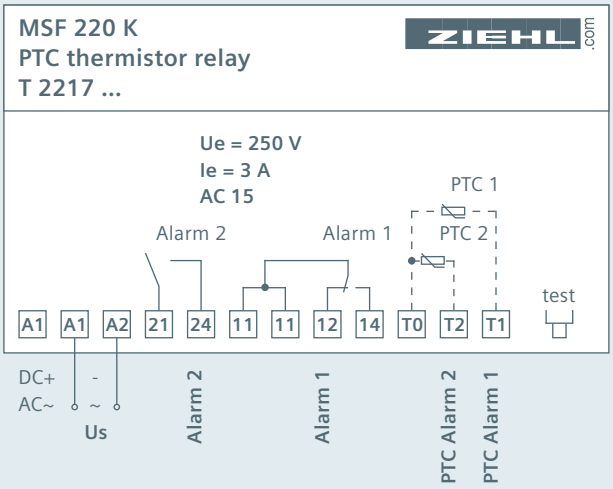
Notes

Unless otherwise indicated on the individual pages of this catalog, the specified values, dimensions, and weights in particular are subject to change without notice. The illustrations are non-binding. All product designations used are trademarks or product names of Siemens AG or other suppliers. All dimensions in this catalog are given in mm unless otherwise stated.

Accessories*)



Terminal diagram: Standard trip relay for PTC sensors

Additional transformer ventilation for more power

GEAFOL Neo transformers can be equipped with fans to increase the power rating by up to about 40%.

With a 30% increase in power rating, for example, the short-circuit losses given in the list are increased by about 69% and the short-circuit voltage increases in linear fashion by 30%.

The fans are automatically switched on or off via temperature sensors in the LV winding in connection with a fan controller.

Temperature monitoring

The temperature of GEAFOL transformers is monitored in the low-voltage winding by means of PTC thermistor detectors or by using PT 100 sensors (on request).

In the case of static converter transformers, the core temperature is also monitored.

The most cost-effective solution is monitoring with PTC thermistor detectors and trip relay without temperature indication.

Every GEAFOL transformer is equipped with at least one PTC thermistor detector loop for tripping.

Function

Temperature monitoring with PTC thermistors:
If two sensor systems are used to monitor temperature, one is wired up to give an alarm and the other to switch off the transformer. The nominal operating temperatures of both systems differ by 20 K. A third system can, for example, take over controlling of the fans.

The temperature sensors function as PTC-resistors:
If the response temperature of a sensor is reached, the resistance rises sharply and the trip relay switches over immediately.

If the winding cools down by about 6 K below the operating temperature, the relay coil in the trip relay is fully energized and the contact switches back.

The ambient temperature of the trip relay is limited to 55° Celsius. It is therefore suitable for installation in medium or low-voltage distribution cabinets.

*) Accessories on request

New housing design

Proven technology in a new design

Innovation is something you can also see, at least when it comes to the new, award-winning GEAFOL housing whose stylistic idiom is based on the new transformer family design. Besides these purely visual aspects, the housing offers our customers other benefits as well.

Higher mechanical stability

Because the transformer and housing are delivered on a common base frame as a permanently mounted unit, they offer an extremely stable, robust overall configuration. This is further supported by the mechanically fixed installation of the transformer and the use of phases at the housing corners. Crossbraces can also be used at the transformer on request.

Greater flexibility and safety

The housing roof can be opened from the inside to permit hoisting by crane. The bolts connecting the housing and transformer are accommodated inside the housing for a higher degree of personnel safety. And thanks to the fully modular construction, a subsequent upgrade to a higher protection class (IP class) is possible at any time. Versions for indoor and outdoor installation in multiple protection classes as well as various installation options such as, for example, "infrared window," are available. Further information upon request.

Standard housing

These housings are available in versions for indoor and outdoor installation. Standard delivery is as a construction kit. For more information, also see the publication "Transforming difficult installations into perfect solutions – GEAFOL standard housing" – EMTR-B10004-01-4A00.

Labyrinth arrangement of ventilation louvers provides additional security against access with wire.

Roof construction of protection class IP23 (indoor installation)

Graphic: Cutaway of the ventilation slots with the roof strips.

Photo: The roof strips are turned down at the side walls and screwed firmly into place.

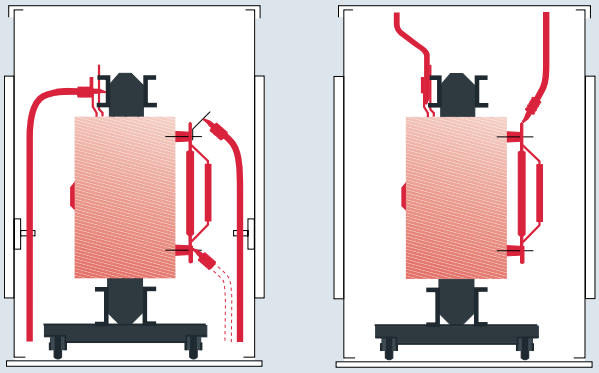
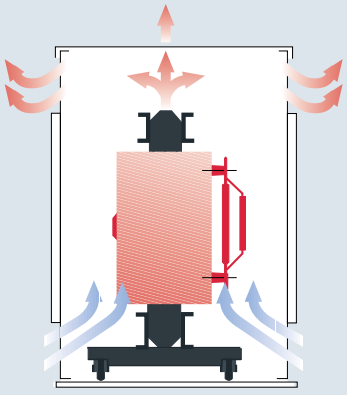
1) Test wire diameter 1 mm according to EN 60529.

Standard housing



Variable connection technology:
The cable can be fed in through the floor, roof, or one of the side walls.



A reduction in power is possible in the case of installation inside the protective housing.

Apart from standard housings, we can supply housings with frame construction and doors that can also be equipped with roof ventilators.
These housing types are also suitable for combined installation with low- and medium-voltage cabinets. Please ask us if you need them.
