Ozone-Free, Needlepoint Bipolar Ionization Solution for Air Quality

Make smart infrastructure part of your solution
for a safer indoor environment.

usa.siemens.com/buildingtechnologies

Offer reliable, long-term protection from surface and airborne pathogens in your facility with this innovative, ozone-free approach to cleaner indoor air. Provided by our solution partner, Sustainability Management Partners called O2Prime™, this needlepoint bipolar ionization solution transforms your building's infrastructure into a front line of defense. Equipment is easily installed in HVAC systems to flood the air with hundreds of millions of positive and negative ions that attack pathogens, mold, and other airborne/surface contaminants.

Creating an environment that protects

This ionization solution treats the air by generating positive and negative ions that normally exist in nature and releases them into the forced air circulation of an HVAC system where they can travel into spaces throughout the building. The ions are capable of attacking viruses, bacteria, pathogens, and mold at the molecular level, breaking them down and robbing them of their hydrogen molecules necessary for survival. Third-party testing has demonstrated effectiveness against certain viruses and bacteria*.

* Results available upon request.

Key Benefits

- Ozone-Free – will not harm lungs
- Can run anytime, including when the space is occupied
- Rapid installation that integrates with building automation system

Supporting Healthy Environments

As the need for protection and risk reduction expands, we're harnessing our capabilities, expertise, and global network of partners to outfit and supply organizations and their facilities in the following ways:

- Identifying sources of potential contamination and offering effective technology to mitigate the risk
- Developing a holistic approach to create environments so that operations can continue safely and efficiently

Needlepoint Bipolar Ionization Technology

VOC Effects

Airborne Particle Effects

Bacteria and Pathogen Effects

Ozone-Free Needlepoint Bipolar Ionization artificially creates millions of positive and negative ions and releases them into the forced air circulation of an HVAC system travelling into spaces inside building(s).

How it works

This needlepoint bipolar ionization solution uses positive and negative ions, forced through a building's HVAC system that are capable of attacking and deactivating certain bacteria, pathogens, airborne particles, and VOCs.

Bacteria & Pathogen Removal – Positive and negative ions react to form hydroxyls. The hydroxyls rob the pathogen of the hydrogen bond, removing the food source.

Airborne Particle Removal – Ions attach to the airborne particle causing the particle to attract nearby particles of opposite polarity. As a result, the particle grows larger and becomes more vulnerable to filtration systems.

VOC Removal – Free-floating ions are used to break down ammonia (NH_3) molecules and other VOCs, and regroups them into safe and desirable gasses, like nitrogen and water vapor, that are already prevalent in our atmosphere.

System and installation options

This ionization solution can be installed at the air handler or in the duct work. Siemens also offers sensors to monitor ion levels being produced. We will analyze system requirements and provide recommendations for optimal implementation.

About Sustainability Management Partners (SMP)

Our mission at SMP is to provide indoor air quality solutions that lead to healthier occupants, increased productivity, and clean, fresh, healthy environments. By reducing the need for outside air, SMP and our O2Prime technology promotes smaller, more cost-effective HVAC systems and can increase energy savings related to heating and cooling.

About Siemens Smart Infrastructure

Siemens Smart Infrastructure brings innovations in smart building technologies to create environments that care in facilities of all types. Our smart infrastructure solutions support the way industry and organizations want to be – efficient, responsible, smarter, and safe.

Ozone-free, needlepoint bipolar ionization deactivates particles smaller than PM_{2.5}.
