

INVITE - Digital Plant Showcase Center with SIMATIC PCS neo and MTP

INVITE GmbH in CHEMPARK in Leverkusen runs a Digital Plant Showcase Center to enable the quick, straightforward testing of promising new digital technologies on a plant. The idea behind the Center is to build a bridge between technology scouting and implementation in actual production. It combines two benefits: The plant maps a production process to minimize the effort involved in transferring to actual operation. It also gives the operator the same degree of flexibility and capabilities as a pilot plant. Initial experience can be gathered and compatibility for actual production can be evaluated.

From a technical point of view, the "Digital Plant" is the centerpiece of the Digital Plant Showcase Center (see Figure 1). The Digital Plant is designed and implemented in a modular fashion in terms of its process, engineering and automation. This makes it flexible in design and open to expansion. Furthermore, standardized communication interfaces enable the straightforward integration of digital technologies.

Each process step is implemented by a module. There are five modules for the Digital Plant:

- 3 dosing modules (short designation BP11, BP12, and BP13)
- 1 mixing/heating module (short designation CM14)
- 1 storing/stirring module (short designation RP23)

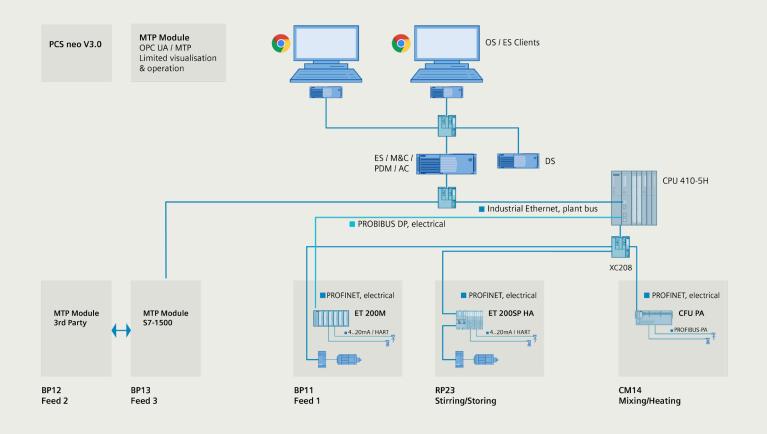

Figure 2: Digital Plant with SIMATIC PCS neo

Automation is already partly modular in line with a brownfield approach. That means two dosing modules (BP12 and BP13) are controlled by means of a Module Type Package (MTP). The modules BP11, CM14 and RP23 are controlled in the usual way via a process control system. Siemens' newly developed SIMATIC PCS neo system software has been deployed as the process control system.

The control configuration of SIMATIC PCS neo consists of a server for engineering, monitoring and control plus two web clients. On the automation side, a CPU 410-5H with ET200SP-HA is used along with CFU-PA with ProfiNet and ET200M with Profibus DP. SINAMICS G120C frequency converters are integrated with ProfiNet (see Figure 2).

SIMATIC PCS neo is operated as a completely web-based system in HTML5 exclusively by web browser; there are no local software installations at all: Users have quick and simple access to all information at any time, from any location via secured connections. Web-based means that web technologies are used in the interaction of server

and clients. This opens up a vast range of new options without requiring a connection to the World Wide Web to operate SIMATIC PCS neo.

"Based on our experience of commissioning, implementing initial changes and realizing the operational phase, we have gained a positive impression of SIMATIC PCS neo," says Mr. Wittenbrink, the project manager at INVITE. Within the framework of multi-user engineering, the user-friendly web client architecture and session management in particular are regarded as very good. Multiple users can work simultaneously on the same project all around the world. Such collaboration is based on clear rights and role management, a secure session concept as well as a consistent object structure in engineering, simulation and automation. This saves time and data management is always consistent.

Besides functioning as a control system, SIMATIC PCS neo also features as a Process Orchestration Layer (POL) (see Figure 3). The POL has the task of integrating and orchestrating modules via the

The Digital Plant shows that it is possible to commission a module or a package unit within 10 minutes in terms of automation.

Module Type Package (MTP). In this specific case, the MTP modules were integrated in SIMATIC PCS neo using the OPC UA communication protocol. Initially, this pilot project worked with limited MTP scope in terms of visualization and operator control in accordance with VDI 2658, on which work is still in progress.

In the case of the MTP module with SIMATIC S7-1500, the SIMATIC MTP (APL) Library was used before it was actually released. The SIMATIC Module Type Package Library (MTP) provides blocks and faceplates based on Advanced Process Library (APL) for the modular automation of various applications.

In order to highlight the fact that MTP is not dependent on a particular manufacturer, a module was also integrated that featured Festo SE & Co. KG control technology. The integration of the MTPs from third-party vendors was also successful. The operators of the Digital Plant noticed no difference between traditional automation, Siemens MTP or Festo MTP.

However, the major benefit of the MTP is in the engineering. "The Digital Plant shows that it is possible to commission a module or a package unit within 10 minutes in terms of automation," says Mr. Wittenbrink. This is possible because the module's visualization and signal interconnection

are already contained in the MTP. Once the MTP package file has been successfully imported in the POL, the contents only need to be sorted into the plant hierarchy and the communication configured via OPC UA, with the result that the "plug and produce" philosophy is realized by means of MTP.

INVITE has already held online presentations on the Digital Plant with SIMATIC PCS neo and MTP for several Bayer plants and other companies. The web-based approach and the possibility of quickly integrating modules or package units via MTP were two features that particularly impressed these audiences, even though some SIMATIC PCS neo V3.0 functionalities that are necessary for the pharmaceutical and processing industries are still undergoing development. The development of SIMATIC PCS neo is being pursued with particular focus on production plants in which SIMATIC PCS 7 is already in use. A further focal issue is the conversion of plants with SIMATIC PCS 7 to SIMATIC PCS neo. The two systems' shared hardware platform and application architecture is of great advantage here.

Subject to changes and errors. The information provided in this brochure contains descriptions or performance characteristics which, in case of actual use, do not always apply as described or which may change as a result of further development of the products. The desired performance characteristics are only binding if expressly agreed in the contract. Availability and technical specifications are subject to change without notice.

All product designations may be trademarks or product names of Siemens AG or supplier companies, the use of which by third parties for their own purposes may violate the rights of the owners.

Invite is continuing to expand its portfolio of digitalization showcases. Currently a pilot setup featuring NAMUR Open Architecture (NOA) can be seen in addition to SIMATIC PCS neo and MTP. This gives a concrete demonstration of how semantically unique and vendor-neutral data from HART-enabled field devices can be used in cloud applications with very little engineering input.
