How **Software as a Service Solutions** Are Transforming Business Operations

HOW CLOUD-BASED SOLUTIONS DELIVER FLEXIBILITY, SECURITY, AND COST SAVINGS

Advantages of **SaaS*** Solutions

In today's fast-paced business environment, cloud solutions have become crucial. They offer unparalleled flexibility, scalability, and efficiency, enabling businesses to stay competitive and agile. Understanding the advantages of cloud-based solutions would help businesses make informed decisions about their technology strategies and adapt to a rapidly changing digital landscape.

*Software as a Service

Asset transparency

Cloud-based solutions allow you to have centralized asset transparency across all locations with geographic view and up-to-date information about all your asset. This allows you to not only see health status, track performance and utilization of your assets, but also benchmark the performance of different locations.

24/7 Accessibility from anywhere

With cloud solutions you can connect and access data from all your locations in one software from anywhere, anytime, in the browser or on the mobile. Data is collected, processed, and analyzed in real-time, providing instant insights.

Mix & Match

Cloud-based solutions enable the integration of multiple dashboards into a single application, offering a combined view of all relevant data. It simplifies monitoring and decision-making, as you can access comprehensive insights for different assets and use cases in one place, enhancing overall efficiency and effectiveness.

Updates & Upgrades

With SaaS solution you always have the latest version of a software available: effortless & automatic updates and upgrades including bug fixes will ensure highest level cyber security of the application.

Cybersecurity transparency

You can get daily vulnerability updates to protect devices from cyber-attacks, as well as information on approved security patches for your installed base. Cloud solutions can help with planning the lifecycle information ahead and minimizing time to patch.

Ecosystem

Cloud enables you to form partnerships with various industries so that you could connect to our partners' dashboards. This means you can easily access and integrate data from different sources, enabling real-time collaboration and data sharing. Since our partners have domain know-how in various areas, it can strengthen our expertise. With the Xcelerator ecosystem we can offer a comprehensive end to end solutions to our customers.

Flexibility and scalability

Cloud applications help you adapt to fluctuating business demands. They allow you to tailor applications to your specific requirements, ensuring that you only pay for what you use, as SaaS applications are modular and offered in packages. This allows you to scale in any direction between different locations or use cases.

Grid-spanning event and alarm notifications

Using the cloud version, you'll receive immediate notifications if any hazardous situations occur at the location. With an on-premise solution, there may be delays in detecting and responding to issues, potentially leading to downtime.

Time and cost saving

Avoid unnecessary field trips by having all the important information on the application. A cloud-based solution allows you to access all critical information directly from the application, eliminating the need for unnecessary field trips. This helps our customers to switch to the condition-based maintenance approach, which can save a lot of OPEX costs.

Infrastructure costs

Traditional IT infrastructure requires significant CAPEX investment in hardware, software, and the staff to maintain it. With the SaaS solutions, no additional IT infrastructure is needed: no additional storage, no computer capacities for analysis. As a result, when using cloud solutions, there are no additional CAPEX/OPEX costs for computing resources.

Historical data & long-term statistics

Leveraging insights from historical data empowers you to identify patterns and trends, thus make proactive decisions. Predictive analytics enables SaaS applications to improve inventory management, ensuring operations are prepared for future challenges and opportunities.

Analytics & AI

A cloud-based solution is suitable for future AI integration since it provides access to advanced AI tools and services, offering valuable insights and optimized processes. In the future it would be possible to receive suggestions based on the information provided by AI as recommendations for predictive maintenance.

We create technology to transform the everyday, for everyone.
Our world is changing at an unprecedented rate. Demographic
change, urbanization, globalization, environmental change,
resource efficiency, and digitalization are presenting new challenges
and opportunities.

Siemens Smart Infrastructure addresses these topics by combining
the real and the digital worlds.

Our technology transforms infrastructure, across buildings,
electrification, and grids, at speed and scale, enabling collaborative
ecosystems to accelerate our customers' digital journey to become
more competitive, more resilient, and more sustainable.
