ASRM – Overview & valued added topics

Inspiring change in intralogistics

Agenda

- **General information** 3
- Structure & Products 7
- Value added topics 17

Storage technology – schematic overview

Storages – the fast buffers in the material resp. production means flow – are a core element of intralogistics

picture source: KardexMlog

Definition:

Automatic Storage and Retrieval Machine

An **Automatic Storage and Retrieval Machine (ASRM)** is a rail-guided, single track vehicle used to store goods in a **high-bay warehouse**. It is also known as **stacker crane** or **rack feeder**.

Curve-negotiable ASRM for reduced powers:

- ASRM to operate the entire warehouse via a switch system resp. change the aisle using a changeover system

Aisle-bound ASRM for high powers:

- ASRM operated in one aisle only

The movements of an ASRM are performed along three axes:

- x = Longitudinal aisle direction → travelling unit
- y = Vertical direction → hoisting unit
- z = Traverse aisle direction → load handling device (load carrier)

(Source Wikipedia)

**In addition to the conveyor technology,
Automatic Storage and Retrieval Machines are the core of storage technology**

Warehouse logistics Requirements and trends

The typical requirements for ASRM are:

- High positioning accuracy
- High level of automation (full automatic operation)
- High payload at low weight of ASRM

Technological trends:

- Increased throughput by
 - Optimized acceleration / deceleration
 - Oscillation damping
 - time optimized moving profiles
- Smart integrated safety concepts (acc. EN 528)
- Energy efficiency (Green Logistics)
 - Multi-axis systems with common DC-link with concepts for energy storage
 - Power and energy optimized moving profiles
- Fast and easy commissioning
- Comfortable and simple diagnostics

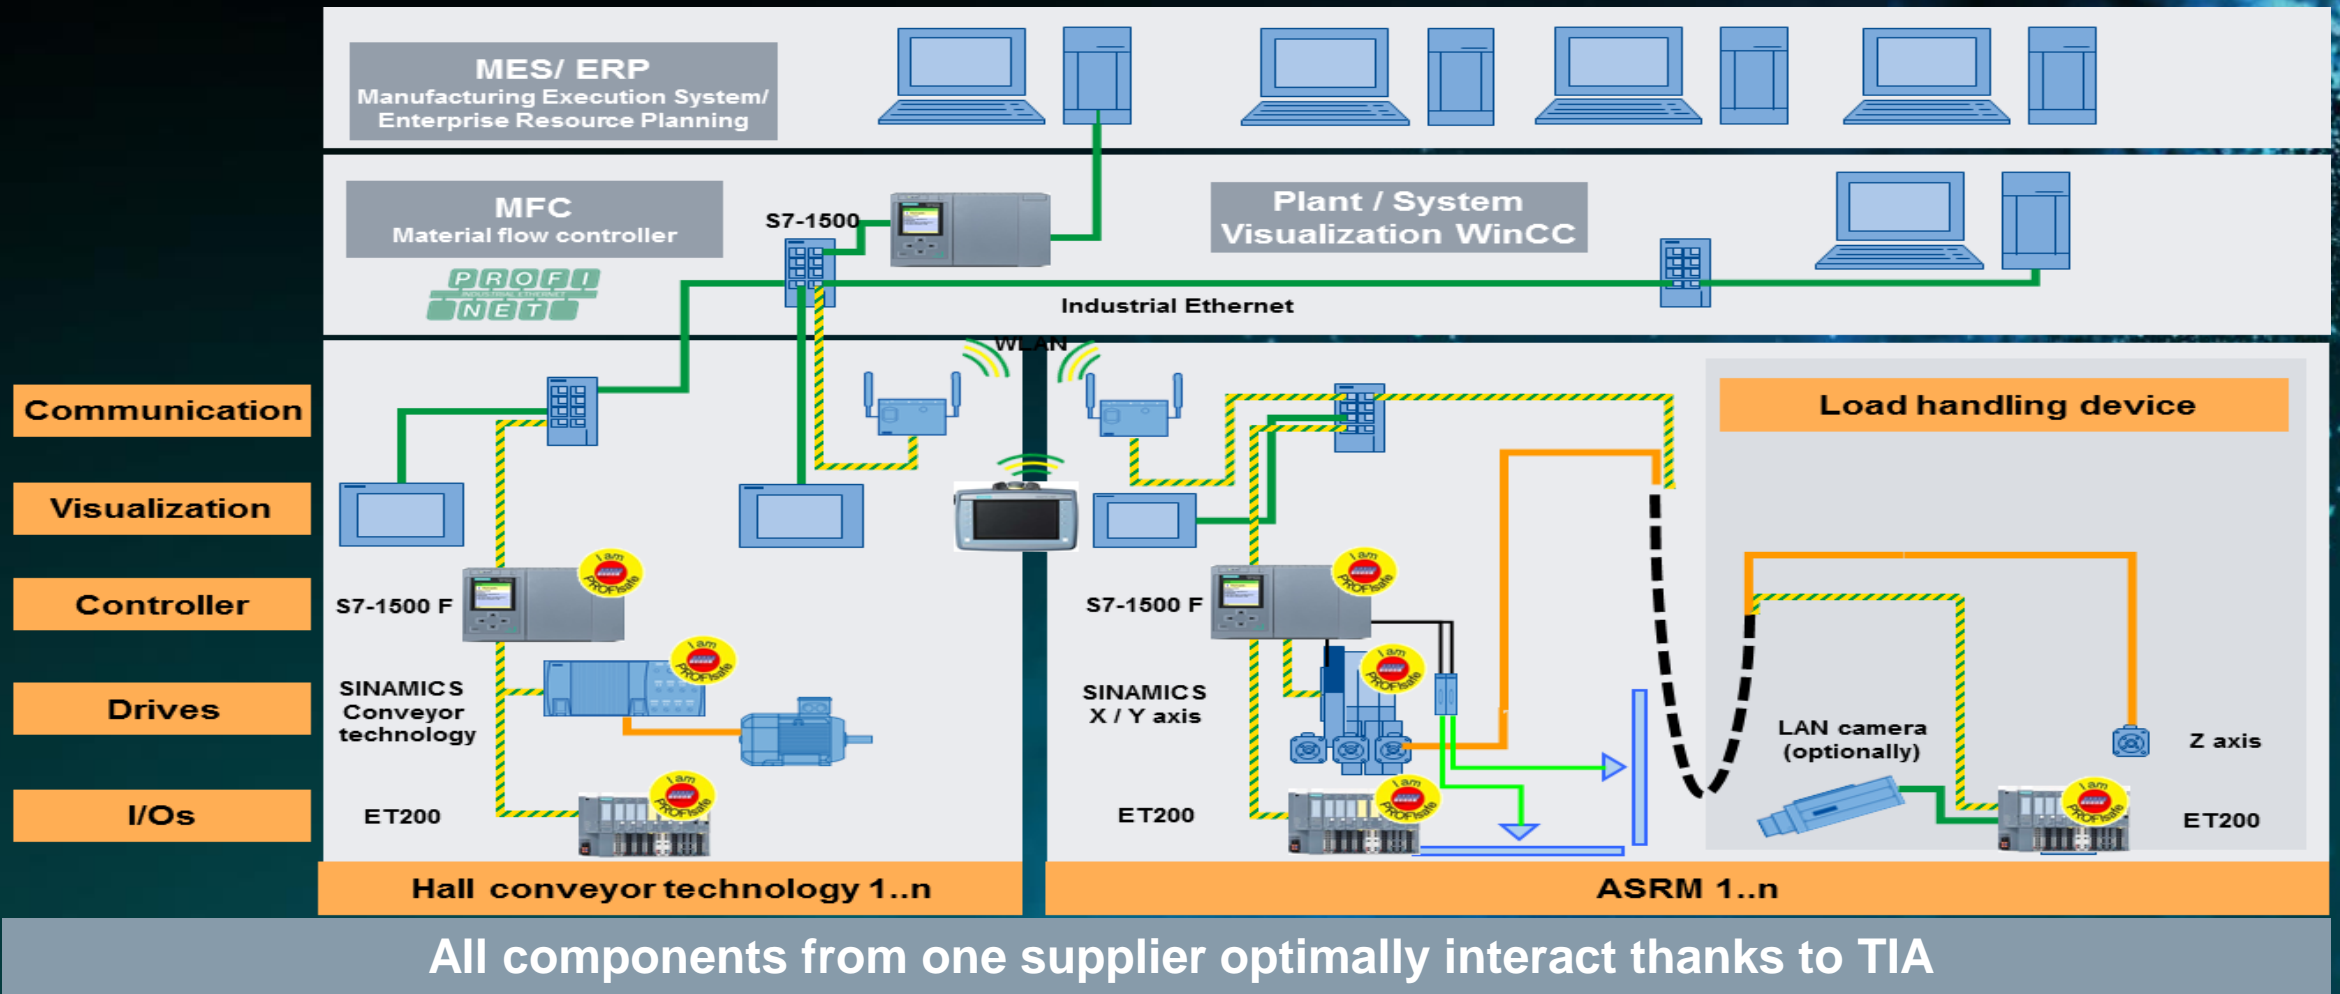

The products from GMC allow us to fulfill the market requirements and generate additional value added

Agenda

- General information 3
- **Structure & Products** 7
- Value added topics 17

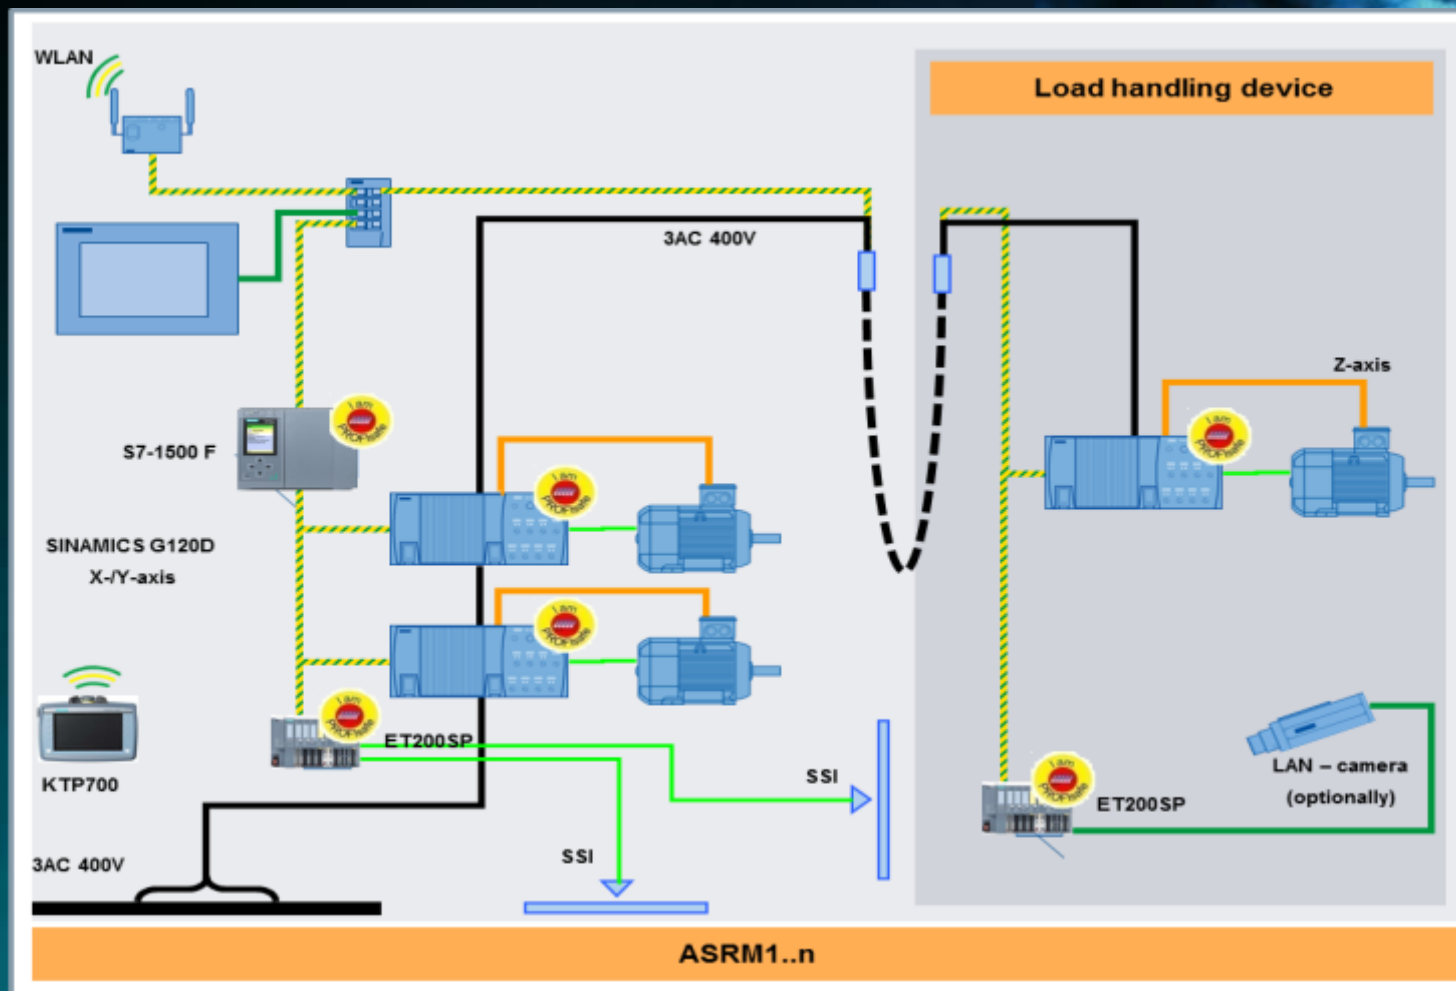

Principal structure of an intralogistics solution

Distributed concept with SINAMICS G120D

Features

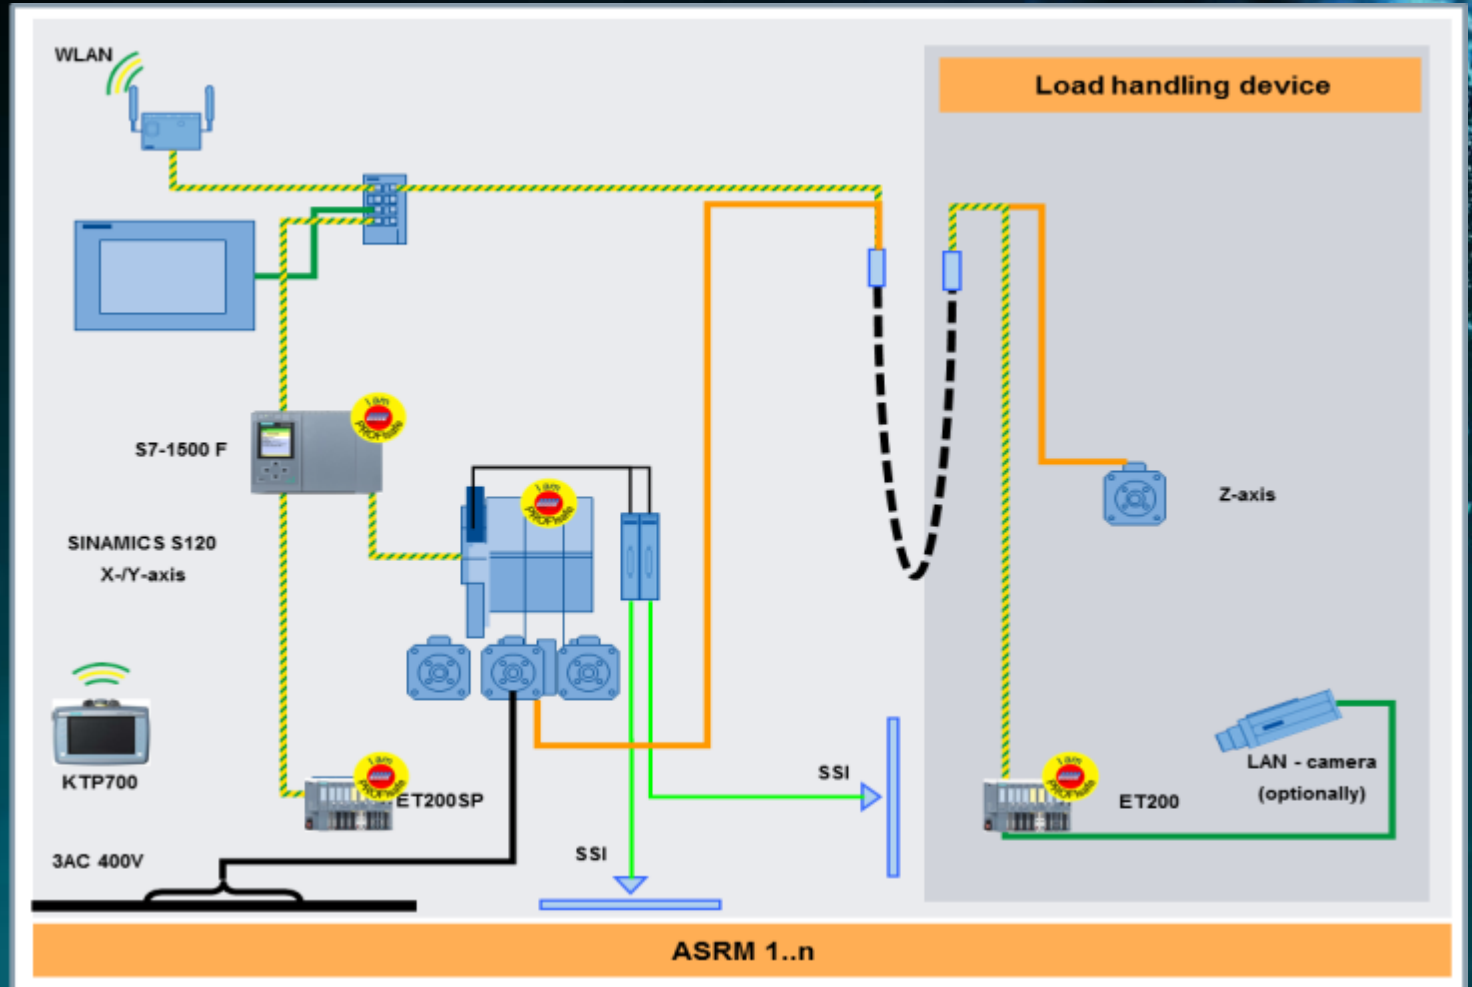

- Degree of protection IP 65
→ no control cabinet required
- Installation directly near the motor
→ reduced wiring
- Energy efficient thanks to energy regeneration capacity
- Integrated positioner (EPOS)
- Safety Integrated
- No line reactor or line filter required
- Up to 7.5 kW (nominal power);
15kW (peak power)

Central concept with SINAMICS S120 Booksize

Features

- Scalable and flexible due to modular structure
- Up to 12 axes per CU
- Central infeed / regenerative feedback
- Highly dynamic control
- Synchronous / induction motors
- Integrated positioner (EPOS)
- Numerous applications thanks to DCC
- Safety Integrated
- Energy efficient through regenerative feedback and energy balancing at the dc link; incl. concept for energy storage

Sensing and communication

Sensor systems

SIMATIC Visionsensor

- Vision sensors for application-specific image processing

Identification systems

SIMATIC Ident

- RFID systems for an optimization of material flow and logistics
- Code reader systems for flexible reading and verification of 1D/2D codes

Communication

SIMATIC NET

- Industrial Ethernet / WLAN
- PROFINET
- PROFIBUS
- AS-i

Control and visualization

Controllers & I/Os

SIMATIC Controller

- Highest scalability
- Selection in the software and hardware architecture:
Modular / embedded / PC-based
- Central / distributed

HMI

SIMATIC HMI

- The finely graduated product range fulfills the most diverse requirements
- From operator panels and visualization software through to the scalable SCADA system

Frequency converters

Distributed

SINAMICS G120D

- High degree of protection IP 65
- Speed control with/without encoder
- Also with integrated position control
- Safety Integrated functions
- Integrated brake control

Central

SINAMICS S120

- Single-axis and multi-axis groups
- Modular / high scalability
- Synchronous and induction motors
- Numerous applications through DCC
- Safety Integrated functions

Gearbox motors

Servo gearbox motors

SIMOTICS S-1FG1

- Based on SIMOTICS 1FK7 with Drive-CLiQ interface
- Compact direct mounting with helical, parallel shaft, bevel or worm gearbox
- Different (holding) brakes available
- Available in axis height AH36 to AH100
- Market usage installation dimensions

Standard asynchronous gearbox motors

SIMOGEAR

- High quality -> long lifetime
- High performance due to high power density, high output torque and wide range of gear ratio
- Compactness and reduced weight
- Easy integration due to usual installation dimensions
- Very high energy efficiency with IE3 motors
- Power range up to 200kW

Safety and Energy

Safety Integrated

Complete and consistent safety program

- From the sensor through to the controller to drives
- Comprehensive service and support
- Support for the application of safety standards

Energy distribution

Failsafe and efficient energy distribution using

- SIVACON switchgear
- SIVACON busbar trunking systems
- SENTRON power switches
- SENTRON multi-function measuring instruments
- SIMATIC PCS 7 powerrate resp. SIMATIC WinCC powerrate

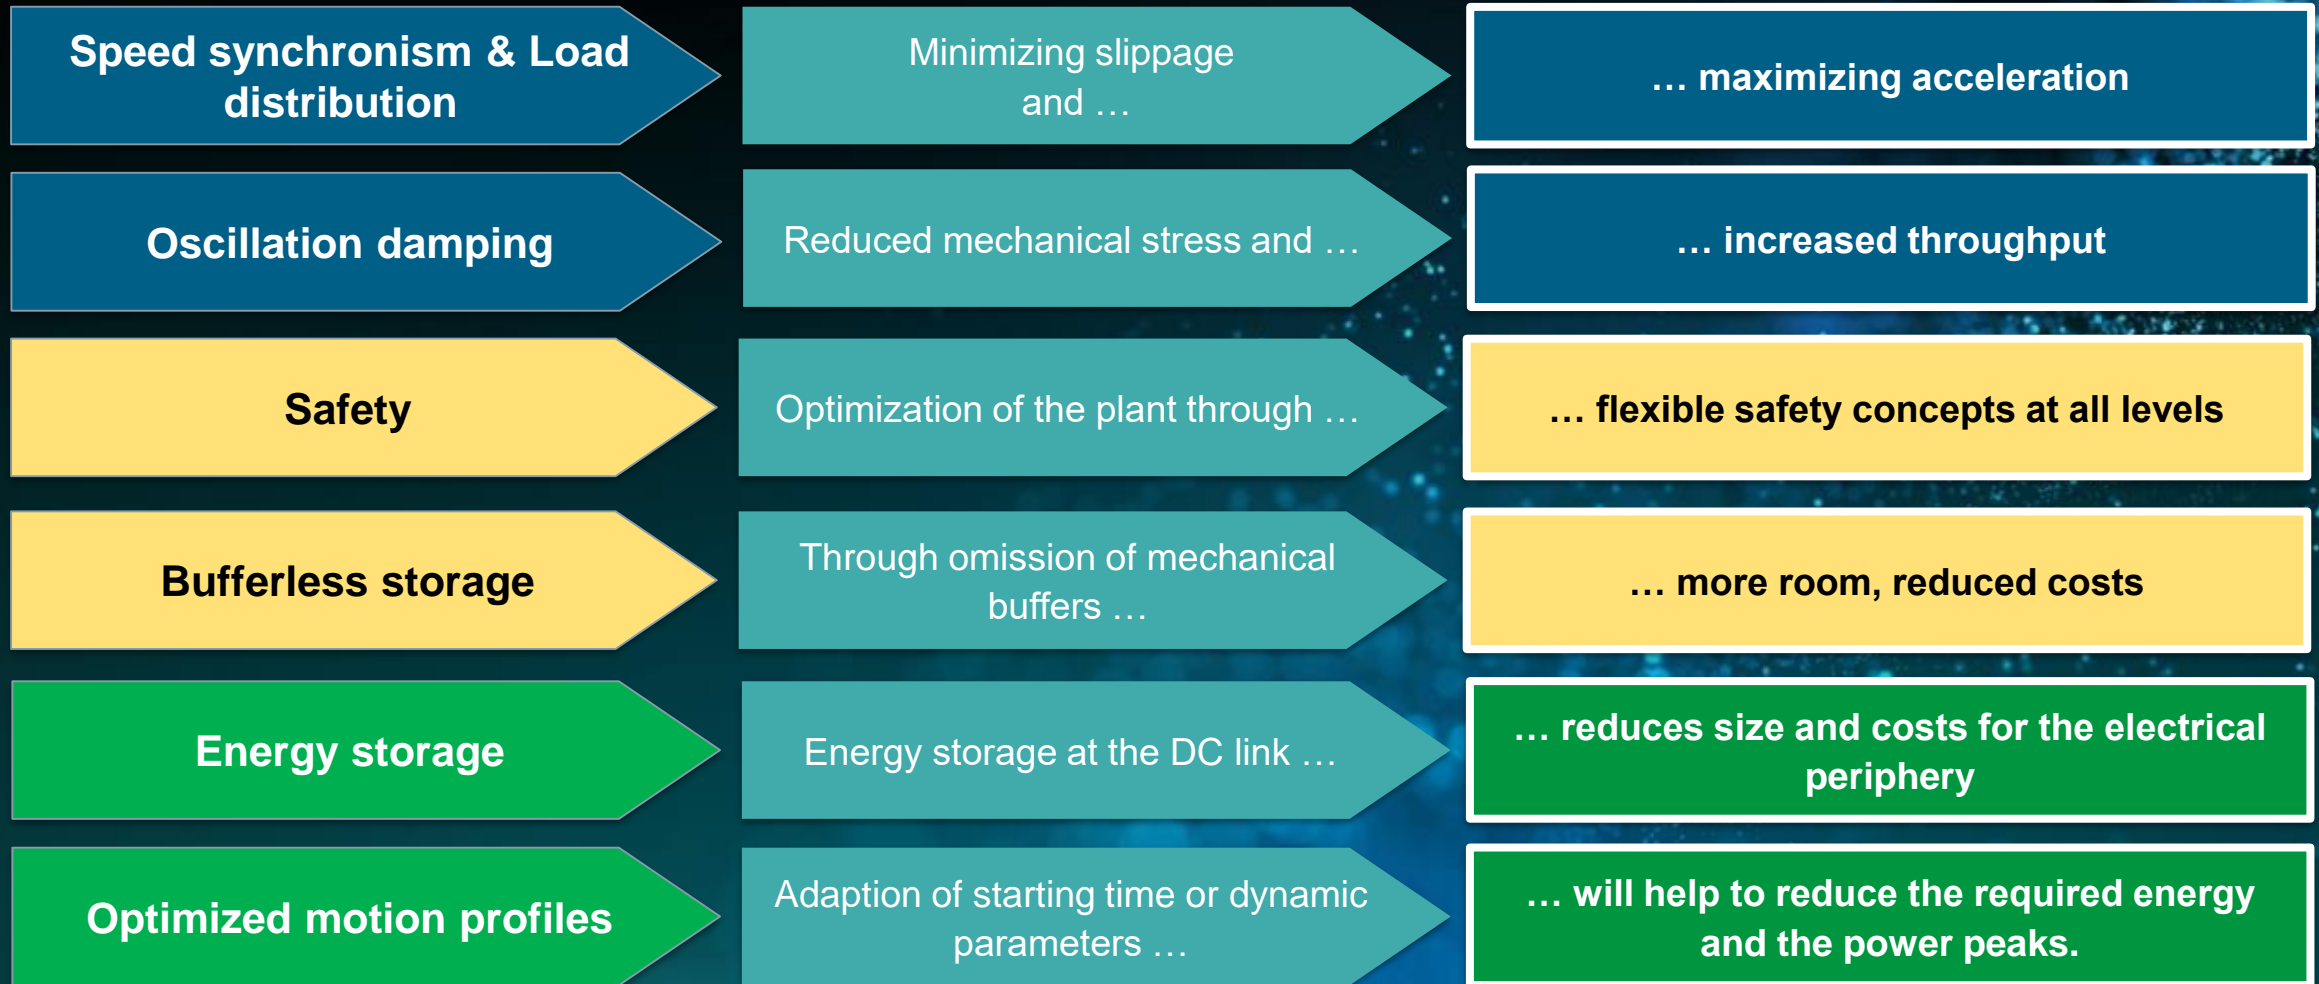

Agenda

- General information 3
- Structure & Products 7
- **Value added topics** 17

ASRM – value added topics

Speed synchronism and load distribution on ASRM with two driven friction wheels

Speed synchronism and load distribution at ASRMs with two driven wheels for the chassis

Speed synchronism

- The DCC controller distributes 50% of the load onto each drive (**M**aster/**S**lave)
- Independently of the friction wheel radius
- Additional pretensioning is possible
 - increase the stiffness of the travelling unit
 - improved control dynamics

Load distribution

- The load is distributed onto the two drives depending on the center of mass offset when accelerating or braking
- Has been implemented as precontrol for torque compensation control
- Less wear at mechanically coupled drives
- Is also used for oscillation damping by drive on top of the tower/mast

<https://support.industry.siemens.com/cs/ww/en/view/72341566>

Oscillation damping

Stimulation of oscillation movement

In general via set point channel

- at acceleration of the ASRM (chassis)
- at deceleration of the ASRM (chassis)
- sometimes also by acceleration and deceleration of the load handling device (movement z axis)

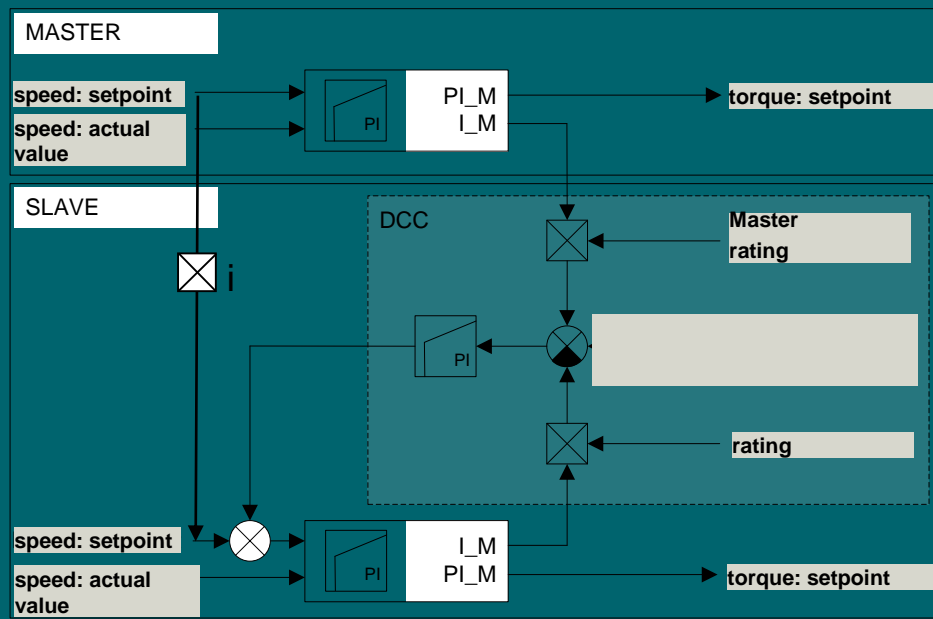

Rarely by “errors” at the actual value:

- jerk in rail
- slip
- damaged friction wheel (e.g. flat spot from braking)

Oscillation damping drive at the tower tip

- Damping of the oscillation movement through constant speed closed loop control
- The drive can also take over a part for chassis movement (approx. 30%)
- Runs in speed synchronism with main drive
- Torque compensation control prevents rigging

Oscillation damping as software solution (VibX)

VibX – Vibration EXtinction:

- is an **SINAMICS Technology Extensions** (SINAMICS TEC) software based solution
- integrated in the set point channel of position controller
- Available for basic positioner (Epos) and external position control with DSC (e.g. for TOs of SIMATIC PLC)
- impact merely on set point (position set point filter)
- no stimulation of mechanical natural frequency
- Adaption of the frequency by an override during operation
- no (additional) actuators and sensors necessary
- no mechanical modifications, perfect for Retrofit

<https://support.industry.siemens.com/cs/ww/en/view/109738131>

Energy storage at the DC link

Ultracapacitors (UC)

Energy storage at the DC link

- Storage of surplus energy in Ultracapacitors (UC)
- Fast exchange of energy between UC and DC link
- High number of load/unload cycles in short periods (seconds)
- Reduce of infeed power up to 90%* (scalable solution)
 - ➔ explicit cost savings at electrical periphery (infeed, wiring, transformer, ...)
- Regenerative feedback can be omitted
- Increased availability (at weak grids)
- New concepts for shutdown of the electrical periphery
 - Less wear for the construction
 - Less wear at mechanical brakes; electrical braking still possible

<https://support.industry.siemens.com/cs/ww/en/view/109748701>

Energy and power optimized moving profiles

Results

1. Avoid power peaks

- Higher losses on the area of maximum power peaks
- Higher monthly costs due to higher power consumption from the grid

2. Usage of regenerative energy from other drive

- Feedback to the grid is not possible or wanted in every case (e.g. if BLM is in use)
- Improvement of the energy balance for the entire system

3. Preserve mechanics

- Reduced wear and tear

Electrical power needed before optimization

Farbe	Bereich		Farbe	Bereich
Grün	< 49[kW]		Gelb	55[kW] ... 59[kW]
Rot	49[kW] ... 55[kW]		Rot	> 59[kW]

Electrical power needed after optimization

Farbe	Bereich		Farbe	Bereich
Grün	< 49[kW]		Gelb	55[kW] ... 59[kW]
Rot	49[kW] ... 55[kW]		Rot	> 59[kW]

An aerial photograph of a large industrial complex, possibly a refinery or chemical plant, featuring several tall distillation columns and large storage tanks. The facility is surrounded by parking lots filled with cars and some greenery. Overlaid on the image are various digital and futuristic elements: a blue grid pattern covers parts of the buildings, a 5G signal icon is visible, and abstract light trails and particle effects suggest a high-tech, digital environment. The sky is clear with a bright sun in the upper right corner.

LEVEL 1

CEO / Management Dashboard

- Net Revenue
- Water Level and Supply
- Distribution & Losses
- Water Quality
- Energy Consumption & Cost
- Critical Assets

Corporate

Balance (Sales & Revenue)

- Net Revenue
- Top Revenue Account and Status
- Production vs Sales
- Revenue by Grids
- Demand & Supply Analysis
- Water Forecast

LEVEL 2

Water Treatment Plant

- Water Level and Production Curves
- Power Efficiency & Consumption
- Power Cost per Production

LEVEL 3

Inventory & Water Levels

- Chemical Material Inventory status
- Precipitation Level
- Weather Forecast

Networking & Supply

- Highlight Water Supply and Water Loss Areas
- Water Shortage Areas in last 24 Hours
- Water Leakage Incidents

Quality Performance

- QC Sample by Location and Results
- Quality of Drinking & Waste Water
- Contamination

Maintenance Management

- Top running pumps
- MTBF vs MTTR
- Equipment Health

Critical Assets

- Pump Efficiency
- Pump Curve

Energy Performance

- Energy Consumption by Pumps
- Pump Schedule & Optimization
- Consumption vs Production
