OT Networking

Bringing IT competence to automation – following a holistic approach

By designing complex networks and infrastructures, ITCore S.p.A. became one of the first solution partners for Siemens in Italy for Industrial Networks & Security. Their solutions are completely secure and compliant with international standards (IEC 62443). This is mandatory because the use of Ethernet-based communication and transport protocols not only brings benefits. It also presents industrial automation with several problems related to the IT security of production infrastructures and plants – the business area under risk increases. Hence, it becomes essential to adopt cybersecurity solutions, methodologies, and techniques to protect industrial assets, safeguarding network security and data generated by plants.

ITCore S.p.A. is a joint stock company founded in 2009, but with roots going back to the 80s. The company is focusing on solutions to solve problems, secure business assets and support the customer in the process of business development through infrastructure and customized technological and information systems. Since 2017, ITCore S.p.A. brought their experience and IT skills into the industrial automation world, working closely together with Siemens.

Cybersecurity

- Network security
- Perimeter security
- Host, endpoint and application security
- Data protection
- ICS and SCADA security
- AI and threat intelligence
- Unified threat management
