## Things you should know about the 2017 Industrial Catalog

This Catalog contains all selection and order-relevant data.

More information can be found on the on-line version of this catalog at [usa.siemens.com/iccatalog](http://usa.siemens.com/iccatalog)

### Navigation

All page references are linked. Click on the page number to navigate to that page.

For accessories, see page [2/66](#)

Clicking on the Page Number square at the bottom of each page will return you to the Table of Contents for that section.

Clicking on the Catalog Reference at the bottom of a page will return you to the Table of Contents for the Catalog.

Siemens Industry, Inc. Industrial Control Product Catalog 2017

### Delivery time (DT)

- ▶ Preferred type
- A 9 to 10 working days
- B 11 to 13 working days
- C 14 to 23 working days
- D 24 to 38 working days
- X On request

Normal quantities of the products are usually delivered within the specified time following receipt of an order.

In exceptional cases, the actual delivery time may differ from that specified.

The delivery times specified here represent the state as of 5/2017. For up-to-the-minute information, please visit our Industry Mall website at [www.usa.siemens.com/industrymall](http://www.usa.siemens.com/industrymall)

Note: Delivery Time (DT) does not appear on all selection pages due to space constraints or coil voltage variations.

### Price units (PU)

The price unit defines the number of units, sets or lengths to which the price and weight apply.

### Packaging sizes (PS)

The packaging size defines the number of units, sets or length, for outer packaging. Only the quantity defined by the packaging size or a multiple thereof can be ordered.

## Symbols

On many selection pages in this catalog, you will find these symbols to aid in the quick identification of critical product features.

#### Connections

Combicon connection	
Insulation piercing method	
Fast Connect	
Spring-type terminals	
Flat connectors	
Solder pin connections	
Ring terminal lug connections	
Screw terminals	

#### Types of coordination

Type of coordination "1"	
Type of coordination "2"	

#### Distinguishing between units

Complete units	
Modular system	

#### Support function

Configurator available in the Industry Mall

## IEC Motor Starter Protectors

## Section 1

SIRIUS 3RV Motor Starter Protectors (MSPs) are built for a wide range of applications and meet the requirements of control users worldwide. Each MSP features a manual ON/OFF switch, a Class 10 adjustable bimetallic overload relay (Class 20 available in the two largest frame sizes), and magnetic trip elements for short circuit protection.

**3RV20** MSPs can be used in a variety of applications:

- \* Manual Motor Starter
- \* Manual Self-Protected Combination Motor Controller, Type E
- \* Combination Motor Controller Type F when combined with a 3RT contactor
- \* IEC Circuit Breaker for export applications

**3RV27** are UL listed as a Circuit Breaker for branch circuit protection of both motor and non-motor loads

**3RV28** is UL listed as a Circuit Breaker for transformer protection

**3RV29** is an infeed system for quick installation of MSP and contactor assemblies

## IEC Contactors

## Section 2

High contact reliability, a narrow design, long life time, and the ability to operate under extreme conditions (up to 60° C), ensure that SIRIUS 3RT Contactors are suited for almost any application. A large array of easily installed, standard accessories may be used to customize the contactors for different applications.

**3RT\*0** – 3 Pole Standard

**3RT12** – 3 Pole Vacuum

**3RT\*3** – 4 Pole with 4 normally open poles for switching Resistive loads (AC-1)

**3RT\*4** – 3 Pole for switching Resistive loads (AC-1)

**3RT\*5** – 4 Pole with 2 normally open & 2 normally closed poles

**3RT\*6** – 3 Pole for switching capacitors

**3RA\*9** – Contactor Accessories

**3RA\*3** – Reversing contactor assemblies

**3TB5** – 3 Pole with true DC coils

**3TC** – 2 Pole for switching DC loads

**3TF6** – 3 Pole Vacuum, 630 & 700A

## IEC Overload Relays

## Section 3

Complete motor protection can be achieved through the SIRIUS family of overload relays (OLR's).

**3RU21** – Thermal OLR's, up to 100 A, are ambient compensated bimetallic in Trip Class 10

**3RB30** – Solid State OLR's, up to 630 A, with an internal power supply and 4:1 FLA adjustment range in Trip Class 10 or 20

**3RB31** – Features of the 3RB20 / 30 plus adjustable Trip Class 5 to 30, ground fault detection, and remote reset

**3RB22 / 23** – Features of the 3RB21 / 31 plus status LED's and external power supply

**3RB24** – Features of the 3RB23 plus communication via IO-Link

**3UF7** – SIMOCODE pro intelligent motor protection is more than just a programmable overload relay. By linking the motor and automated control circuits, SIMOCODE allows for predictive and conditional maintenance on critical systems.

**Section 4**

**IEC Combination Starters**

The SIRIUS 3RA1/2 Combination Starters consist of a pre-wired and mechanically connected 3RV MSP and 3RT contactor, allowing for quick installation of a complete branch circuit. The Non-Reversing or Reversing assemblies come on a Fast Bus mounting shoe or as a Panel Mount version.

The SIRIUS 3RA6 Compact Starters provide the functionality of an MSP, Contactor and Electronic Overload Relay in one easy to install housing, saving wiring and installation time. Available in both non-reversing and reversing starters that can be mounted on a Fast Bus shoe. The SIRIUS 3RA6 Infeed system further saves line side wiring in multiple motor panels.

- 3RA21** – Non-Reversing Combination Starters
- 3RA22** – Reversing Combination Starters
- 3RA6** – Compact Non-Reversing & Reversing Combination Starters

**Section 5**

**Fast Bus Power Distribution System**

The UL508A Fast Bus Multi-Motor Control System is a 3 phase insulated busbar system used to reduce wire connections and hole drilling when building control panels. Quickly mount Sirius 3RA combination starters and/or Siemens circuit breaker assemblies.

The Siemens Fast Bus system uses standard off-the-shelf components, with both domestic and international approvals, to allow for economical installation, compact panel designs, touch safe equipment, that allow for easy expansion and maintenance.

- FB** – Installation kits for quick ordering & installation
- FBCB** – Circuit breakers pre-assembled on Fast Bus adapter shoes
- 3RA** – Combination starters for Fast Bus mounting (see section 4)
- 8US** – Fast Bus components for Field assembly

**Section 6**

**Hybrid Motor Starters**

SIRIUS 3RM1 motor starters are compact devices with a width of 22.5 mm, combining a large number of functions in a single unit. They consist of combinations of relay contacts, power semiconductors (hybrid technology), and a solid state overload relay for operational switching of three phase motors up to 3 HP @ 480 V.

Hybrid technology provides reduced size, lower heat losses and longer service life in motor starter applications. Even the reversing units are only 22.5mm wide.

- 3RM10** – Non-reversing starters
- 3RM11** – Non-reversing starters with safety related shutdown
- 3RM20** – Reversing starters
- 3RM21** – Reversing starters with safety related shutdown

## Solid State Soft Starters

## Section 7

SIRIUS Solid State Soft Starters are designed to ramp up your efficiency at every turn. Easy to specify, integrate, operate, and maintain, our controls fulfill your need for more thoughtful system-wide solutions. With innovations, such as 2 phase control up to 300HP@ 480V to a high end Profibus DP capable soft starter, Siemens is your trusted source for soft start control.

**3RW30** – Soft Starters in compact frame sizes up to 75HP for standard applications

**3RW40** – A compact Soft Starter from 7.5 to 300HP, with built-in bypass contacts, overload protection and device self protection

**3RW44** – A high feature Soft Starter offering, from 15HP to 900HP, with built-in bypass contacts, overload protection, torque control functionality, multiple parameter settings, braking and slow speed capability, programmable inputs and outputs, and kick start and multiple starting and stopping modes

**Class 73** – Non-Combination Enclosed Soft Starters

**Class 74** – Combination Enclosed Soft Starters with circuit breaker or fusible disconnect

## Solid State Switching Devices

## Section 8

Designed for high operating switching frequency the Sirius Solid State Relays and Contactors feature a long lifespan of rugged reliability in adverse conditions, quiet operation, compact size, and snap on function modules for convenient flexible use.

**3RF20** – 1-Phase Relays in a 45mm wide “hockey-puck” design

**3RF21** – 1-Phase Relays in a 22.5mm narrow width design

**3RF22** – 3-Phase Relays in a 45mm wide design

**3RF23** – 1-Phase Contactors, a 22.5mm wide relay mounted to a heat sink

**3RF24** – 3-Phase Contactors, a 45mm wide relay mounted to a heat sink

**3RF29** – Function Modules, such as, converters, load monitors and power controllers

**3RF34** – 3-Phase non-reversing and reversing Contactors for switching

## General Purpose Control

## Section 9

Siemens NEMA controls are built rugged to withstand the most severe and demanding industrial and continuous duty commercial applications. Siemens offers the most complete and diverse product line in the world of NEMA. This includes standard full NEMA sizes and motor matched half sizes exclusive to Siemens. All are available as open or enclosed devices with a wide selection of accessories and spare parts.

Manual Starters & Switches

Non-Reversing & Reversing Starters & Contactors

Multi-Speed Starters

Reduced Voltage Starters – Autotransformer and Wye-Delta

Combination Starters

Pump Controllers

Overload Relays – Solid State & Bimetallic with Replaceable Heaters

Current Sensitive Relays

Lighting & Heating Contactors

Control Power Transformers

Section 10

Pilot Devices

Siemens offers an extensive array of Pilot Devices and Signal Columns for a wide variety of applications.

- 3SB2** – 16mm SIRIUS Pilot Devices for applications where panel space is a premium
- 3SU1** – 22mm SIRIUS ACT Pilot Devices offer maximum flexibility, industry best time install savings and environmental ratings in round-metal and round-plastic versions
- Class 50** – Standard Duty Control Stations
- Class 52** – 30mm is the classic pushbutton design for the NEMA markets offering both standard die cast metal and the ultra rugged BLACK MAX for corrosion resistant applications
- Class 51** – 30mm in NEMA 7 & 9 for hazardous locations
- 8WD** – Signal Columns offer twist and connect technology in both 50mm and 70mm diameter styles. Single element signal beacons add additional options for OEMs and panel builders

Section 11

Function Relays

The SIRIUS family of compact, DIN rail mountable function relays offers complete solutions for monitoring, switching, interfacing and timing applications.

- 3RN** – Thermistor Motor Protection
- 3RP / 7PV** – Solid State Timing with single or multiple timing functions
- 3RS10 / 20** – Temperature Monitoring in solid, liquid and gaseous media
- 3RQ** – Coupling Relays and Interfaces
- 3RS18** – Relay Interfaces
- 3RS70** – Interface Converters
- 3TG10** – Compact Power Relays/Contactors
- 3TX71** – Plug-in Relays & Timers
- 3UG4** – Line Monitoring of voltage and insulation or load monitoring of Current & Cos Phi, Level Monitoring of conductive liquids, and under speed monitoring

Section 12

Terminal Blocks

For the wiring of machines and control systems, Siemens Terminal Blocks meet or exceed the requirements of CSA, IEC, NEMA, UL, VDE and other international standards. Meeting these requirements, combined with worldwide acceptability and availability, enables Siemens Terminal Blocks to be used domestically, as well as, in equipment which will be exported.

- 8WA1 / 8WH1** – Terminals with Screw Connection
- 8WH2** – Terminals with Spring-Loaded Connection
- 8WH3** – Terminals with Insulation Displacement Connection
- 8WH5** – Terminals with Combination Plug-in Connection
- 8WH6** – Terminals with iPo Plug-in and Installation Connections

Section 12 contains the 'Table of Contents' of the Terminal Block Supplemental Catalog, Order No. PDCA-TERMB-1013; Labeling Plates for Ink Plotter System; and, Special Label Instructions for 8WA terminal block labeling plate inscriptions.

## Safety Systems

## Section 13

Siemens Switches and Machine Safety devices provide the means for protecting workers and equipment where hazardous conditions exist. Compliance with NEMA, OSHA and international standards (IEC) are a critical requirement for machine OEMs and end users. Siemens has provided safety relay and contactor products to the international community for almost 50 years.

- 3SB38** – Two-Hand Control Stations
- 3RK3** – Modular Safety System (MSS)
- 3SE03** – North American (NEMA) Limit Switches
- 3SE5** – International (IEC) Limit Switches
- 3SE5 / 3SE2** – Interlock Switches & Hinge Switches
- 3SE6** – RFID Non-Contact Safety Switches & Magnetic Monitoring Systems
- 3SE7** – Cable-Operated Switches
- 3SK** – Modular Safety Relays
- 3TK28** – Safety Relays with special functions.

## AS-Interface & IO-Link Systems

## Section 14

**Actuator-Sensor Interface** is the simple and effective networking system for the field level. It is extremely rugged even under the toughest of conditions. With compatible safety components, AS-Interface offers safety applications according to Safety Category 4. AS-Interface is easily linked to higher-level networks for a complete automation solution — simple, safe and fast in the field.

**IO-Link** is an open communication standard based on point-to-point connection between a Master and up to 4 devices. For an OEM wiring multiple motor starters, IO-Link technology can greatly reduce control cabinet wiring for motor starters while increasing diagnostics. For End Users, IO-Link provides a cost effective way in to monitor common analog values such as motor current, power consumption, temperature and voltage without adding an additional network.

## Programmable Relays & Power Supplies

## Section 15

The LOGO! Programmable Relay is a compact, easy to use and low cost solution for simple control tasks. Functions can be changed at the touch of a button through the integrated operator panel or remote display.

SITOP offers a broad offering of compact single- and 3-phase switched mode power supplies and 24VDC power security components, which provide reliable solutions for the most common power interruptions, helping to minimize downtimes and increase the efficiency of production.

SCALENCE Managed and Unmanaged Industrial Ethernet Switches with up to eight RJ45 ports.

- 6ED1** – LOGO! Programmable Relays
- 6EP1** – SITOP Power Supplies and Power Security Components
- 6GK5** – SCALENCE Industrial Ethernet Switches

**Section 16**

**Control Circuit Protection**

Siemens UL 489 miniature circuit breakers and accessories are designed to provide branch circuit and feeder protection.

Siemens UL 1077 Supplementary Protectors are designed to provide additional protection where branch circuit protection is already provided or, not required at all. Since Siemens Supplementary protectors are made to trip faster than other components, they are able to provide additional protection for more sensitive devices inside a panel.

- 5SJ4** – Miniature Circuit Breakers up to 480Y / 277 VAC, 63A
- 5SY** – High feature Supplementary Protectors from 0.3 to 63A
- 5SP** – High amperage Supplementary Protectors from 80 to 125A
- 3NW7** – Cylindrical Fuse Holders meeting UL 512 and IEC 60269-1, -2, -3
- 3NC1** – Open type Cylindrical Fuse Holders meeting UL 512

**Section 17**

**Circuit Breakers**

Siemens offers a full line of interchangeable and non-interchangeable thermal-magnetic trip circuit breakers with a wide variety of interrupting ratings from 10KAIC to 200KAIC. These circuit breakers are available with multi-functional internal accessories, which are field installable on most breakers, and a full line of external accessories. Electronic trip circuit breakers are available for 150A through 1600A breakers.

- Molded Case Circuit Breakers
- BQ and QJ** – 240VAC Breakers
  - CQD** – 480VAC Breakers
  - GG, Sentron, and VL** – 600VAC Breakers

- Insulated Case and Power Circuit Breakers
- WL frame** – 600VAC

**Section 18**

**Switches**

Siemens offers a complete line of both enclosed and open style switches to meet a wide range of applications.

- HF & HNF** – Heavy Duty Safety Switches with Side Mounted Operating Handle
- 3LD2** – Rotary Switches in Non-metallic Enclosures
- VBF & VBNF** – Open Switches with Flange Mounted Operating Handle
- MCS** – Open Switches with Flange or Rotary Operating Handle
- CFS** – Open Compact Fusible Switches with Rotary Operating Handle

# For Motor Protection

3RV20 Class 10 – up to 40A

MOTOR STARTER PROTECTORS 1

Description	Ordering Information
<p>The 3RV20x MSPs are UL approved as Self Protected Combination Motor Controllers which are also called Type E. In this application, all the required functions for a motor branch are provided in one device: disconnect, short circuit protection, motor control and overload protection. A type E terminal adaptor is required. The 3RV20x MSPs are also approved for use as follows:</p> <ul style="list-style-type: none"> <li>– Manual Motor Controller: Motor starter, motor disconnect, control and overload—protection.</li> <li>– Group Installation: Motor starter only, motor disconnect, control and overload protection.</li> <li>– Tap conductor Protection in Group Installation acc. NEC: Motor starter only; motor disconnect, control and overload protection.</li> </ul> <p>When the 3RV20x is used with one of the 3 above mentioned approvals, the 3RV20x can be installed downstream of one circuit breaker or fuse set.</p> <p>For more detailed application information and rules how to apply, size and rate the 3RV20x in control panels in general, in group installations or in accordance to international IEC standards visit our website: <a href="http://www.usa.siemens.com/controlpaneldesign">www.usa.siemens.com/controlpaneldesign</a></p>	<ul style="list-style-type: none"> <li>▶ ON/OFF rotary handle with lockout and visible trip indication.</li> <li>▶ Adjustment dial for setting to motor FLA.</li> <li>▶ Class 10 overload trip characteristics.</li> <li>▶ Short circuit trip at 13 times the maximum setting of the FLA adjustment dial.</li> <li>▶ Short circuit current rating:</li> <li>▶ Ambient compensated up to 140° F (applies to side by side mounting).</li> <li>▶ Phase loss sensitivity.</li> <li>▶ Test trip function.</li> <li>▶ Terminal versions: screw, spring, ring lug.</li> <li>▶ Auxiliaries and Accessories see pages 1/7–1/17.</li> <li>▶ General Information see pages 1/29–1/32.</li> <li>▶ Technical Data see pages 1/18–1/28.</li> <li>▶ Dimensions see page 1/33.</li> </ul>

Note: Select MSP by motor Full Load Amperes. Horsepower ratings are for reference only.

1) Select motor starter protector by motor full load amps. Horsepower ratings for reference only.

2) The motor starter protectors rated up to 32 A can be used as manual motor controllers or as Type E combination motor controllers. For use as a Type E combination motor controller, a Type E terminal is required. See accessories page 1/10.

3) These products are NOT certified as Type E combination motor controllers. They can only be used as manual motor controllers.

4) 3RV2 MSPs can only be used with Innovations contactors and accessories

# For Motor Protection

3RV10 Class 10 & 20 – up to 100A

Description	Ordering Information
<p>The 3RV203/204 MSPs are UL approved as Self Protected Combination Motor Controllers which are also called Type E. In this application, all the required functions for a motor branch are provided in one device: disconnect, short circuit protection, motor control and overload protection. A type E terminal adaptor is required for all S2 frame 3RV2031 above 45A and all S2 frame 3RV2032 as well as for all S3 frame motor starter protectors.</p> <p>The 3RV203/204 MSPs are also approved for use as follows:</p> <ul style="list-style-type: none"> <li>– Manual Motor Controller: Motor starter, motor disconnect, control and overload protection.</li> <li>– Group Installation: Motor starter only, motor disconnect, control and overload protection.</li> <li>– Tap conductor Protection in Group Installation acc. NEC: Motor starter only; motor disconnect, control and overload protection.</li> </ul> <p>When the 3RV203/204 is used with one of the 3 above mentioned approvals, they can be installed downstream of one circuit breaker or fuse set.</p> <p>For more detailed application information and rules how to apply, size and rate these MSPs in control panels in general, in group installations or in accordance to international IEC standards visit our website: <a href="http://www.usa.siemens.com/controlpaneldesign">www.usa.siemens.com/controlpaneldesign</a></p>	<ul style="list-style-type: none"> <li>▶ ON/OFF rotary handle with lockout and visible trip indication.</li> <li>▶ Adjustment dial for setting to motor FLA.</li> <li>▶ Class 10 overload trip characteristics.</li> <li>▶ Short circuit trip at 13 times the maximum setting of the FLA adjustment dial.</li> <li>▶ Short circuit current rating:</li> <li>▶ Ambient compensated up to 140° F (applies to side by side mounting).</li> <li>▶ Phase loss sensitivity.</li> <li>▶ Test trip function.</li> <li>▶ Auxiliaries and Accessories see pages 1/7–1/17.</li> <li>▶ General Information see pages 1/29–1/32.</li> <li>▶ Technical Data see pages 1/18–1/28.</li> <li>▶ Dimensions see page 1/33.</li> </ul>

Note: Select MSP by motor Full Load Amperes. Horsepower ratings are for reference only.

1) Select motor starter protector by motor full load amps. Horsepower ratings for reference only.

2) Size S2 and S3 are listed as type E combination motor controllers. For required Type E terminals see page 1/10. 3RV2031 MSPs with a current setting limit of 45A or less do not require a type E terminal and fulfill the spacing requirements of UL508.

3) Shaded ratings apply for group installation only. These ratings do not apply as UL listed manual combination starters.

4) Pre-assembled motor starter protector and transverse auxiliary switch with 1NO + 1NC is available. Replace the last digit of the order no. with a "5".

5) 3RV1 MSPs can only be used with 3RT1 contactors and accessories. 3RV2 MSPs can only be used with 3RT2 contactors and accessories.

6) For 100kA SCCR rated MSPs, change the part number from 3RV2031 to 3RV2032. (applies to S2 frame only through 65A).

Refer to pages 1/18 to 1/20 when using an MSP in a Manual Motor Starter or a Manual Self-Protected Combination Motor Controller.

1) 100 % rated value acc. to UL 489 and IEC 60947-2 (100 % rated breaker).

2) Circuit breakers for system protection of motor and non-motor loads. Requires use of separate overload protection for motor applications.

3) Circuit breakers for system and transformer protection according to UL/CSA. Specially designed for transformers with high inrush current.

4) Transverse and lateral auxiliary switches can be ordered separately (see "Mountable accessories").

5) Transverse auxiliary switches must not be mounted. Lateral auxiliary switches can be ordered separately (see "Mountable accessories").

Refer to page 1/21 when using as upstream protection of a Manual Motor Controller or a Manual Motor Controller Suitable for Tap Conductor Protection in Group Installations.

2) This product is also available with ring lug terminals. The order no. must be changed in the 8th position to a "4": e.g. 3RV2901-4E

3) Each motor starter protector can be fitted with one transverse and one lateral auxiliary switch. The lateral auxiliary switch 2 NO + 2 NC is used without transverse auxiliary switch.

4) One signaling switch can be mounted at the left of the motor starter protector. This accessory cannot be used on the 3RV27 and 3RV28 circuit breakers.

5) One auxiliary release can be mounted at the right of each MSP: motor starter protector.

6) The response voltage at the lower limit of the voltage range at 0.85 (Tu=60°C) is valid for 100% (infinite)

7) The response voltage at the lower limit of the voltage range at 0.9 (Tu=60°C) applies for a duty cycle of 5 seconds at AC 50/60 Hz and DC.

# Accessories

## Mounting accessories

### Overview

#### Accessories for "Self-Protected Combination Motor Controllers (Type E)" according to UL 508/UL 60947-4-1

The 3RV20 motor starter protectors with screw terminals are approved according to UL 508/UL 60947-4-1 as "Self-Protected Combination Motor Controllers (Type E)".

This requires increased clearance and creepage distances (1 inch and 2 inches respectively) at the input side of the device, which are achieved by mounting a terminal block or a phase barrier.

SIRIUS 3RV2928-1H terminal block

SIRIUS 3RV2938-1K phase barrier

3RV2031-4J.1., 3RV2031-4K.1., 3RV2031-4R.1., 3RV2031-4W.1., 3RV2031-4X.1., 3RV2032	S2	3RV2938-1K phase barrier
3RV204	S3	3RT2946-4GA07 terminal block

-- No accessories needed

Special threephase infeed terminals are required for constructing "Type E Starters" with an insulated threephase busbar system (see page 1/8).

The 3RV29 infeed system also enables the assembly of "Type E Starters", see page 1/14 onwards.

**Note:**

According to CSA, these terminal blocks and the phase barriers can be omitted when the device is used as a "Self-Protected Combination Motor Controller (Type E)".

### Link modules

Feeders can be easily assembled from single devices with the help of the link modules. The following table shows the different combination options for devices with screw or spring-type terminals.

Combination devices	3RV2 motor starter protectors/ circuit breakers	3RT2 contactors; 3RW30, 3RW40 soft starters; 3RF34 solid-state contactors	Link modules	
			Screw terminals	Spring-type terminals
	Size	Size

1) If required, an additional N terminal can be mounted (e.g. 8WA10 11-1BG11).

2) For S2 versions, see 3RV1933-1DA00 (black) or 3RV1933-1GA00 (red/yellow)

# Accessories

## 3RV29 infeed system

MOTOR STARTER PROTECTORS 1

### Overview

The 3RV29 infeed system is a convenient means of energy supply and distribution for a group of several motor starter protectors or complete motor starters with a screw or spring-type connection in sizes S00 and S0 (exception: this system cannot be used for the 3RV21, 3RV27 and 3RV28 motor starter protectors/circuit breakers).

The 3RV29 infeed system is approved in accordance with IEC to 500V. It is also UL approved and authorized for "Self-Protected Combination Motor Controller" (Type E starter) as well as for Type F starter (Type E starter + contactor). The system is based on a basic module complete with a lateral incoming unit (three-phase busbar with infeed). This infeed with spring-type terminals is mounted on the right or left depending on the version and can be supplied with a maximum conductor cross-section of 4 AWG (with end sleeve). A basic module has two sockets onto each of which a motor starter protector can be snapped.

Expansion modules are available for extending the system (three-phase busbars for system expansion). The individual modules are connected through an expansion plug.

The electrical connection between the three-phase busbars and the motor starter protectors is implemented through plug-in connectors. The complete system can be mounted on a TH 35 standard mounting rail to EN 60715 and can be expanded as required up to a maximum current carrying capacity of 63 A.

The system is mounted extremely quickly and easily thanks to the simple plug-in technique. Thanks to the lateral infeed, the system also saves space in the control cabinet. The additional overall height required for the infeed unit is only 30 mm. The alternative infeed possibilities on each side offer a high degree of flexibility for configuring the control cabinet: Infeed on left-hand or right-hand side as well as infeed on one side and out-feed on the other side to supply further loads are all possible. A terminal block with spring-type connections in combination with a standard mounting rail enables the integration of not only SIRIUS motor starter protectors but also single-phase, 2-phase and 3-phase components such as 5SY miniature circuit breakers or SIRIUS relay components.

3RV29 infeed system

### ① Three-phase busbars with infeed

A three-phase busbar with infeed unit is required for connecting the energy supply. This module comprises one infeed module and 2 sockets which each accept one motor starter protector. A choice of two versions with infeed on the left or right is available. The infeed is connected using spring-type terminals. The spring-type terminals permit conductor cross-sections of up to 25 mm<sup>2</sup> with end sleeves. An end cover is supplied with each module.

### ② Three-phase busbars for system expansion

The three-phase busbars for system expansion allow the system to be expanded. There is a choice of modules with 2 or 3 sockets. The system can be expanded as required up to a maximum current carrying capacity of 63 A. An expansion plug is supplied with each module.

#### ③<sup>a</sup> Expansion plug

The expansion plug is used for electrical connection of adjacent three-phase busbars. The current carrying capacity of this plug equals 63 A. One expansion plug is supplied with each three-phase busbar for system expansion. Additional expansion plugs are therefore only required as spare parts.

#### ③<sup>b</sup> Extra-wide expansion plug

The wide expansion plug makes the electrical connection between two three-phase busbars, thus performing the same function as the 3RV29 17-5BA00 expansion plug; the electrical characteristics (e.g. a current carrying capacity of 63 A) are identical.

The 3RV29 17-5E expansion plug is 10 mm wider than the 3RV29 17-5BA00 expansion plug, hence in the plugged state there is a distance of 10 mm between the connected three-phase busbars. This distance can be used to lay the auxiliary current and control current wiring ("wiring duct"). The motor starter protector and contactor can be wired from underneath, which means that the complete cable duct above the system can be omitted.

### ④ End cover

The end cover is used to cover the three-phase busbar at the open end of the system. This cover is therefore only required once for each system. An end cover is supplied with each three-phase busbar system with infeed. Further end covers are therefore only required as spare parts.

### ⑤ Plug-in connector

The plug-in connector is used for the electrical connection between the three-phase busbar and the 3RV2 motor starter protector. These plug-in connectors are available in versions for screw or spring-type terminals.

### ⑥ Contactor base

Motor starters can be assembled in the system using the contactor base. The contactor bases are suitable for contactors sizes S00 and S0 with spring-type and screw terminals and are simply snapped onto the three-phase busbars. Direct-on-line starters and reversing starters are possible. One contactor base is required for direct-on-line starters and two are required for reversing starters.

To assemble motor starters for reversing starters, the contactor bases can be arranged alongside each other (90 mm overall width). In this case the mechanical interlocking of the contactors is possible. The contactor bases are also suitable for soft starters size S00 and S0 with screw connection.

The infeed system is designed for mounting on a 35 mm standard mounting rail with 7.5 mm overall depth. This standard mounting rail gives the contactor base a stable mounting surface to sit on. If standard mounting rails with a depth of 15 mm are used, the spacer connected to the bottom of the contactor base must be knocked out and plugged into the mating piece that is also on the underside. Then the contactor base also has a stable mounting surface. When standard mounting rails with a depth of 7.5 mm are used, the spacer has no function and can be removed.

The link modules are used for direct start motor starters, in which case the use of a contactor base is not absolutely necessary. Motor starter protector and contactor assemblies can then be directly snapped onto the sockets of the three-phase busbars. For starters of size S00 and S0, the corresponding 3RA19 21-1...., 3RA29 11-2...., 3RA29 21-1.... or 3RA29 21-2.... link modules should generally be used.

### ⑦ Terminal block

The 3RV29 17-5D terminal block enables the integration of not only SIRIUS motor starter protectors but also single-phase, 2-phase and 3-phase components. Using the terminal block the 3 phases can be fed out of the system; which means that single-phase loads can also be integrated in the system. The terminal block is plugged into the slot of the expansion plug and thus enables outfeeding from the middle or end of the infeed system. The terminal block can be rotated through 180° and be locked to the support modules of the infeed system. The 3RV19 17-7B 45 mm standard mounting rail for screwing onto the support plate is available in addition in order to be able to plug the single-phase, 2-phase and 3-phase components onto the infeed system.

# General Data

## 3RV – up to 100 A (Domestic applications)

### Permissible rated data of devices approved for North America (UL/CSA)

Motor starter protectors of the 3RV2 series are approved for UL/CSA, and according to UL508/UL 60947-4-1 and CSA C22.2 No. 14/CSA C22.2 No. 60947-4-1 they can be used on their own or as load feeders in combination with a contactor.

These motor starter protectors can be used as "Manual Motor Controllers" for "Group Installations", as "Manual Motor Controllers Suitable for Tap Conductor Protection in Group Installations" and as "Self-Protected Combination Motor Controllers" (Type E).

### 3RV motor starter protectors as "Manual Motor Controllers"

If used as a "Manual Motor Controller", the motor starter protector is always operated in combination with an upstream short-circuit protection device. Approved fuses or a circuit breaker according to UL 489/CSA C22.2 No. 5 can be used. These devices must be dimensioned according to the National Electrical Code (UL) or Canadian Electrical Code (CSA).

Approval of the 3RV as a Manual Motor Controller can be found under the following file numbers:

- UL File No. 47705, CCN: NLRV,
- CSA Master Contract 165071, Product Class: 3211 05.

1) HP rating = Power rating in horse power (maximum motor rating).  
 2) FLA = Full Load Amps/Motor full load current.  
 3) Corresponds to "short-circuit breaking capacity" according to UL/CSA.  
 4) The values in brackets only apply to 3RV2.23 motor starter protectors.

# General Data

## 3RV – up to 100 A (Domestic applications)

### 3RV motor starter protectors as "Manual Motor Controllers Suitable for Tap Conductor Protection in Group Installations"

The application as "Manual Motor Controllers Suitable for Tap Conductor Protection in Group Installations" is only available from UL.

CSA does not recognize this approval! When the motor starter protector is used as a "Manual Motor Controller Suitable for Tap Conductor Protection in Group Installations", it must always be combined with upstream short-circuit protection. As short-circuit-protection device, approved fuses or a motor starter

protector according to UL 489 can be used.

These devices must be dimensioned according to the National Electrical Code.

The 3RV motor starter protectors are approved as "Manual Motor Controllers Suitable for Tap Conductor Protection in Group Installations" under the following file number:

- UL File No. 47705, CCN: NLRV.

<sup>3)</sup> Complies with "short-circuit breaking capacity" according to UL.

# General Data

## 3RV – up to 100 A (Domestic applications)

3RV motor starter protectors as "Self-Protected Combination Motor Controllers (Type E)"

UL 508/UL 60947-4-1 approval demands 1-inch clearance and 2-inch creepage distance at line side for "Self-Protected Combination Motor Controller Type E".

Therefore, 3RV20 motor starter protectors of sizes S00 to S2 are approved according to UL 508/UL 60947-4-1 in combination with the terminal blocks listed below.

CSA does not require these extended clearances and creepage distances. According to CSA, these terminal blocks can be omitted

when the device is used as a "Self-Protected Combination Motor Controller".

The 3RV20 motor starter protectors are approved as "Self-Protected Combination Motor Controllers" under the following file numbers:

- UL File No. E156943, CCN: NKJH
- CSA Master Contract 165071, Product Class: 3211 08

# General Data

## 3RV27/28 circuit breakers

### 3RV27/28 circuit breakers

These circuit breakers are approved according to UL 489 and CSA C22.2 No. 5-02 for 100 % rated current (100 % rated breaker). They can be used therefore as upstream short-circuit protective devices for "Manual Motor Controllers" and "Manual Motor Controllers Suitable for Tap Conductor Protection in Group Installations".

The 3RV27/28 circuit breakers are approved under the following file numbers:

- UL File No. E235044, CCN: DIVQ,
- CSA Master Contract 165071, Product Class: 1432 01.

1) Complies with "short-circuit breaking capacity" according to UL.

# General Data

## 3RV – up to 100 A (Export applications)

MOTOR STARTER PROTECTORS

### Technical specifications

#### Short-circuit breaking capacity $I_{cu}$ , $I_{cs}$ acc. to IEC 60947-2

This table shows the rated ultimate short-circuit breaking capacity  $I_{cu}$  and the rated service short-circuit breaking capacity  $I_{cs}$  of the 3RV2 motor starter protectors/circuit breakers with different inception voltages dependent of the rated current  $I_n$  of the motor starter protectors/circuit breakers.

Power can be supplied to the motor starter protectors/circuit breakers via the terminals at the top or at the bottom without restricting the rated data. If the short-circuit current at the place of installation exceeds the rated short-circuit breaking capacity of the motor starter protector/circuit breaker as specified in the

table, a back-up fuse is required. It is also possible to install an upstream motor starter protector/circuit breaker with a limiter function.

The maximum rated current for the back-up fuse is specified in the tables. The rated ultimate short-circuit breaking capacity then applies as specified on the fuse.

#### Fuseless construction

Motor starter protector contactor combinations for short-circuit currents up to 150 kA can be ordered in the form of fuseless load feeders according to Chapter 6.

Motor starter protectors/circuit breakers	Rated current $I_n$	Up to 240 V AC <sup>1)</sup>			Up to 400 V <sup>1)</sup> /415 V AC <sup>2)</sup>			Up to 440 V <sup>1)</sup> /460 V AC <sup>2)</sup>			Up to 500 V <sup>1)</sup> /525 V AC <sup>2)</sup>			Up to 690 V AC <sup>1)</sup>

Short-circuit resistant up to at least 50 kA

° No back-up fuse required, since short-circuit resistant up to 100 kA

1) 10 % overvoltage.

2) 5 % overvoltage.

3) Back-up fuse only required if the short-circuit current at the place of installation >  $I_{cu}$ .

4) Alternatively, fuseless limiter combinations for 690 V AC can also be used.

# General Data

## 3RV – up to 100 A (Export applications)

### Short-circuit breaking capacity $I_{cuIT}$ in the IT system (IT network) according to IEC 60947-2

3RV motor starter protectors are suitable for operation in IT systems. Values valid for triple-pole short-circuit are  $I_{cu}$  up to  $I_{cs}$ . In case of double ground fault on different phases at the input and output side of a motor starter protector, the special short-circuit breaking capacity  $I_{cuIT}$  applies. The specifications in the table below apply to 3RV motor starter protectors.

In the colored areas,  $I_{cuIT}$  is 100 kA, or in some ranges it is 50 kA. Therefore the motor starter protectors are short-circuit resistant in these ranges.

If the short-circuit current at the place of installation exceeds the rated short-circuit breaking capacity of the motor starter protector as specified in the table, a back-up fuse is required. The maximum rated current for the back-up fuse is specified in the tables. The rated short-circuit breaking capacity then applies as specified on the fuse.

Motor starter protectors	Rated current $I_n$	Up to 240 V AC <sup>1)</sup>		Up to 400 V <sup>1)</sup> /415 V AC <sup>2)</sup>		Up to 500 V <sup>1)</sup> /525 V AC <sup>2)</sup>		Up to 690 V AC <sup>1) 5)</sup>

MOTOR STARTER PROTECTORS 1

## Technical data

### Rules for mounting motor starter protectors/circuit breakers

When mounting MSPs, the following clearance must be maintained to grounded or live parts.

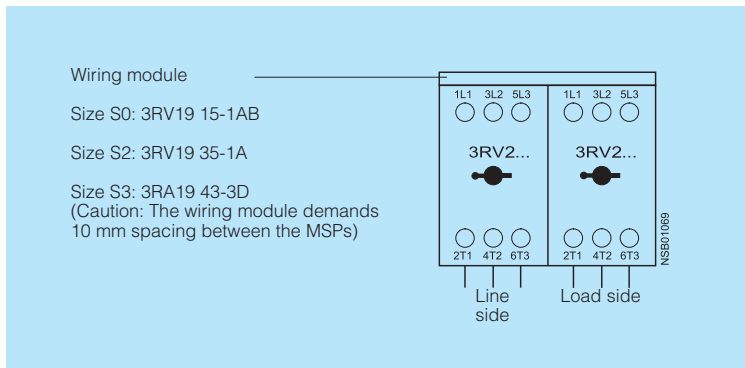

SIRIUS MSP			Clearance to grounded or live parts		
Type	size		Y mm	X mm	at the side Z mm
3RV2.1	S00	up to 690 V	30	70	9
3RV2. 2	S0 <sup>2)</sup>	up to 500 V up to 690 V	30 50 <sup>1)</sup>	90 90	9 30
3RV2. 3	S2	up to 690 V	50	—	10
3RV2. 4	S3	up to 240 V	50	167	10
		up to 440 V	70	167	10
		up to 500 V	110	167	10
		up to 690 V	150	167	30
3RV27 42	S3	up to 240 V up to 400 V	90 90	167 167	10 10

Minimum clearance between MSPs and grounded or live parts

- 1) Up to and including the setting range of 32 A. For the 36/40 A setting range the clearance is 70 mm.
- 2) In conjunction with the type E terminal block 3RV2928-1H the applicable lateral clearance is 30 mm for all voltages.

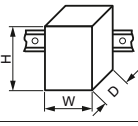

Standard mounting for S0, S2 and S3

# General Data

3RV – up to 100 A

## Overview

**S00 MSP with laterally mounted undervoltage release with leading auxiliary switch**

3RV Motor Starter Protectors (MSPs) are built for a world of applications while meeting the requirements of control users worldwide. Each MSP features a manual ON/OFF switch, a Class 10 adjustable bimetallic overload relay (Class 20 available in the two largest frame sizes), and magnetic trip elements for short circuit protection.

## Construction

The motor starter protectors are available in four sizes:

- Size S00 - 3RV201  
Maximum rated current is 16 Amps. Suitable for motors up to 10 HP at 600V. Available in both screw terminal and spring-type terminal versions.
- Size S0 - 3RV202  
Maximum rated current is 40 Amps. Suitable for motors up to 20 HP at 600V. Available in both screw terminal and spring-type terminal versions.
- Size S2 - 3RV203  
Maximum rated current is 50 Amps. Suitable for motors up to 50 HP at 600V.
- Size S3 - 3RV204  
Maximum rated current is 100 Amps. Suitable for motors up to 100 HP at 600V.

## Functions

### Releases

3RV motor starter protectors are equipped with bimetallic-based, inverse-time delayed overload releases - electromagnetic short-circuit releases.

The overload releases can be set in accordance with the load current. The overcurrent releases are permanently set to a value 13 times the rated current and thus enable trouble-free start-up of motors.

The scale cover can be sealed to prevent unauthorized adjustments to the set current.

### Release classes

The release classes of thermally delayed releases are based on the tripping time ( $t_A$ ) at 7.2 times the operational current in cold state (excerpt from IEC 60 947-4):

- CLASS 10  $A \ 2 \text{ s} < t_A < 10 \text{ s}$
- CLASS 10  $4 \text{ s} < t_A < 10 \text{ s}$
- CLASS 20  $6 \text{ s} < t_A < 20 \text{ s}$
- CLASS 30  $9 \text{ s} < t_A < 30 \text{ s}$

The release must trip within this time!

### Operating mechanisms

S00, S0, S2 and S3 MSPs are actuated via a rotary operating mechanism. If the MSP trips, the rotary operating mechanism switches to the tripped position to indicate this. Before the MSP is reclosed, the rotary operating mechanism must be reset manually to 0 position, in order to prevent the former from closing by mistake before the fault has been cleared.

In the case of MSPs with rotary operating mechanisms, an electrical signal can be output via a signalling switch to indicate that the MSP has tripped.

All operating mechanisms can be locked in 0 position with a padlock (shackle diameter 3.5 to 4.5 mm).

## Application

### Operating conditions

3RV MSPs are suitable for use in any climate. They are designed for operation in closed rooms under normal conditions (e.g. no dust, corrosive vapours or harmful gases). Suitable enclosures must be provided for installation in dusty or damp rooms.

### Motor Protection

3RV MSPs use bimetallic heater elements to provide class 10 or 20 overcurrent protection for both AC and DC motors. The bimetallic heaters sense the motor current directly, so the overloads are insensitive to high frequencies, harmonic waves and sinusoidal currents and voltages.

Each MSP has a fourth bimetallic strip that reacts only to the ambient temperature inside the control panel. This ambient compensation prevents the MSP from nuisance tripping when the panel temperature is higher than the ambient temperature of the motor.

A built-in differential trip bar causes the MSP to trip faster on a phase loss condition, to help reduce motor damage from phase loss.

Magnetic trip elements in each MSP take the device off line when it senses currents of 13 times the maximum FLA dial setting.

**Note:** MSPs and Contactors of the same frame size are made to easily fit together with the use of a link module.

# General Data

## Mounting accessories

1  
MOTOR STARTER  
PROTECTORS

**Applications:**

*The 3RV MSPs can be used in a variety of applications:*

**As a manual starter**

All 3RV MSPs are UL listed as Manual Motor Controllers per UL508. This makes them ideal for applications requiring simple manual starting and stopping of motors. A separate short circuit protective device, such as a circuit breaker or fuses, is still required ahead of the MSP. This up-stream protective device should be sized per NEC code, not to exceed 400% of the maximum FLA adjustment dial setting.

**As a component in a group installation**

A group motor installation indicates multiple motor controllers under one short circuit protective device, such as a circuit breaker. 3RV MSPs have a group installation short-circuit current rating of 65 kA at 480V and up to 30kA at 600V. By using a link module, a 3RT contactor can be directly mounted to the load side of the MSP.

3RV MSPs have been UL tested with and without 3RT contactors for group installation.

**As a Self-protected manual combination starter, Type E.**

Most 3RV MSPs have also been UL listed as UL508 Type E, Self-protected Manual Combination Starters. This UL listing allows the MSP to be mounted in a manually operated machine without having to add separate short circuit protection upstream.

These devices have a short circuit current rating of 65 kA @ 240V, 480Y/277V and up to 30kA @ 600Y/347V.

**Terminals for "Combination Motor Controller Type E" to UL 508**

The 3RV MSP for motor protection is approved according to UL 508 as "Combination Motor Controller Type E".

As of July, 2001, UL 508 demands at line-side of the device used for this purpose an increased clearance and creepage distance (1" or 2").

Here, the terminal block 3RV29 28-1H must be used for size S0. The block is simply screwed to the basic unit.

Basic units of size S2 are already compliant with new clearance and creepage distance requirements.

**As part of a Combination Motor Controller, Type F**

When a 3RT contactor is connected to the load side of a 3RV device that is rated as a "Manual Self-protected Combination Motor Controller, Type E", the assembly can be applied as a "Combination Motor Controller, Type F". This versions allows for remote starting and stopping of the motor load.

These assemblies have a short circuit current rating of 65 kA @ 240V, 480Y/277V and up to 30 kA @ 600Y/347V.

**As a circuit breaker for export**

When exporting to many countries outside of the U.S. and North America, the 3RV can be applied as a thermal magnetic circuit breaker for use in motor branch circuits.

3RV29 28-1K      3RV29 38-1K

3RV29 28-1H

The terminal block 3RT29 46-4GA07 must be used for size S3. The standard box terminal is to be replaced by this terminal block.

According to CSA, these terminal blocks can be omitted when the device is used as "Combination Motor Controller Type E".

By using a link module, a 3RT contactor can be directly mounted to the load side of a 3RV MSP. This assembly of a 3RV and a 3RT provides a complete, remotely operated, combination starter, Type F.

# General Data

## 3RV – up to 100 A

### Switching of direct current

3RV motor starter protectors for alternating currents are also suitable for DC switching.

The maximum permissible DC voltage per conducting path must, however, be adhered to. Higher voltages require a series connection with 2 or 3 conducting paths.

The response values of the overload release remain unchanged; the response values of a short-circuit release increase by approximately 30 % for DC. The example circuits for DC switching can be seen in the table below.

Example circuit for size S00 to S3 3RV motor starter protectors

Example circuit for size S00 to S3 3RV motor starter protectors	Maximum permitted DC voltage $U_e$	Notes
	150 V DC	Three-pole switching, non-grounded system <sup>1)</sup> If there is no possibility of a ground fault, or if every ground fault is rectified immediately (ground-fault monitoring), then the maximum permitted DC voltage can be tripled.
	300 V DC	Two-pole switching, grounded system The grounded pole is always assigned to the individual conducting path, so that there are always 2 conducting paths in series in the event of a ground fault.
	450 V DC	Single-pole switching, grounded system 3 conducting paths in series. The grounded pole is assigned to the unconnected conducting path.

<sup>1)</sup> It is assumed that this circuit always provides safe disconnection even in the event of a double ground fault that bridges two contacts.

### Design

#### Mounting

The motor starter protectors are secured in position by snapping them onto 35 mm standard mounting rails according to DIN EN 50 022. A mounting rail with a height of 15 mm is required for S3 MSPs. A 75-mm mounting rail can be used as an alternative here.

S2 and S3 MSPs can also be screwed directly onto a base-plate.

The push-in lugs 3RV29 28-0B are available for screw mounting of S00 and S0 MSPs.

#### Screw connection

3RV MSPs of sizes S00 and S0 are fitted with terminals with captive screws and clamping pieces, allowing the connection of 2 conductors with different cross-sections.

The box terminals of the S2 and S3 MSPs also enable 2 conductors with different cross-sections to be connected. With the exception of S3 MSPs which are equipped with 4 mm hexagon socket terminal screws, all terminal screws are tightened with a Pozidriv screwdriver size 2.

The box terminals of the S3 MSPs can be removed in order to connect conductors with cable lugs or connecting bars. A terminal cover is available to help prevent contact with shock protection and to ensure that the required clearances and creepage distances are maintained if the box terminals are removed.

#### Spring-type connection <sup>2)</sup>

As an alternative to screw terminals, S00 and S0 devices are also available with Spring-type terminal connection.

This screwless Spring-type terminal technique, as known for modular terminal blocks, offers shock-proof and vibration proof connection of conductors.

Devices with Spring-type connection allow independent connection of two conductors per terminal.

#### MSP with Spring-type terminal connection

<sup>1)</sup> It is assumed that this circuit always provides safe cut-out, even in the event of a double earth fault that bridges two contacts.  
<sup>2)</sup> For notes on Spring-type terminal connection, see section 19.

MOTOR STARTER PROTECTORS 1

## Characteristics

The time/current limiting characteristic, the current limiting characteristics and the  $I^2t$  characteristics were determined in accordance with DIN VDE 0660 or IEC 60 947.

The tripping characteristic of the **inverse-time delayed overload releases** (thermal overload releases or 'A' releases) for DC and AC with a frequency of 0 to 400 Hz also apply to the time/current characteristic.

The characteristics apply to the cold state. At operating temperature, the tripping times of the thermal releases are reduced to approximately 25 %.

Under normal operating conditions, all three poles of the device must be loaded. The three main conducting paths must be connected in series in order to protect single-phase or DC loads.

With 2-pole and 3-pole loading, the maximum deviation in the tripping time for 3 times the setting current and upwards is  $\pm 20\%$  and thus in accordance with DIN VDE 0165.

The tripping characteristics for the instantaneous, electromagnetic overcurrent releases

(short-circuit releases, 'N' releases) are based on the rated current  $I_n$  that represents the maximum value of the setting range for MSPs with adjustable overload releases. If the current is set to a lower value, the tripping current of the 'N' release is increased by a corresponding factor.

The characteristics of the electromagnetic overcurrent releases apply to frequencies of 50/60 Hz. Appropriate correction factors must be used for lower frequencies up to  $16 \frac{2}{3}$  Hz, for higher frequencies up to 400 Hz and for DC.

The printed characteristic curve determined for the MSP relates to a specific setting range. It is, however, also valid as a schematic representation of MSPs with other current ranges.

Typical time/current characteristic of 3RV

### Overview

#### Mounting location and function

The 3RV2 motor starter protectors/circuit breakers have three main contact elements. In order to achieve maximum flexibility, auxiliary switches, signaling switches, auxiliary releases and isolator modules can be supplied separately.

These components are easily fitted to the switches without the use of any tools according to requirements.

Overview graphic, [see page 7/7](#).

#### Typical circuits

##### 3RV2 MSPs with 3RV29 21-1M signalling switch

- |   |        |                         |
|---|--------|-------------------------|
| H1: "Short circuit" signal                              | H1; H2 | Indicator lights        |
| H2: "Overload" or "Tripped by auxiliary release" signal | F1     | Fuses (gL/gG) max. 10 A |
|   | Q1     | MSP                     |
|   | S1     | Signalling switch       |

Separate "Tripped" and "Short circuit" signals

##### Motor starter protectors tripped by means of pushbutton or EMERGENCY STOP button in the system

- The leading auxiliary contacts open in "OFF" position of the MSP to switch off the coil voltage of the undervoltage release, thus avoiding power consumption in switched off state.
- In the "tripped" position of the MSP, these contacts are not guaranteed to open.
- |            |                           |
|------------|---------------------------|
| F1; F2     | Fuses (gL/gG) max. 10 A   |

## Accessories – Busbar accessories

### Overview

#### Busbar adapters

The MSPs are mounted directly with the aid of busbar adapters on FastBus-busbar systems with 40 mm and 60 mm centerline spacing, in order to save space and to reduce wiring times and costs.

FastBus-busbar adapters for busbar systems with 40 mm centerline spacing are suitable for copper busbars with a width of 12 mm to 15 mm, while those with 60 mm centerline spacing are suitable for widths of 12 mm to 30 mm. The busbars can be 4 to 5 mm or 10 mm thick.

The MSPs are snapped onto the adapter and connected on the line side. This prepared unit is then plugged directly onto the busbar system, and is thus connected both mechanically and electrically at the same time.

Refer to page 1/10 for busbar adapters for specific MSPs and accessories.

Further busbar adapters for snap-mounting direct-on-line starters and reversing starters, as well as additional accessories such as line terminals and outgoing terminals, busbar copper, etc., can be found in Section 5.

#### SIRIUS MSPs and combination starters with FastBus-busbar adapters snapped onto busbars

#### Insulated three-phase busbar system

Three-phase busbar systems provide an easy, time-saving and clearly arranged means of feeding 3RV2 motor starter protectors with screw terminals. They can be used for the different types of motor starter protector up to 32 A. The 3RV19 15 three-phase busbar systems are generally unsuitable for the 3RV21 motor starter protectors for motor protection with overload relay function and for the 3RV27 and 3RV28 circuit breakers according to UL 489 / CSA C22.2 No. 5-02.

The busbars are suitable for between 2 and 5 circuit breakers/motor starter protectors. However, any kind of extension is possible by clamping the tags of an additional busbar (rotated by 180°) underneath the terminals of the respective last motor starter protector.

A combination of motor starter protectors of different sizes is possible. The motor starter protectors are supplied by appropriate feeder terminals.

#### SIRIUS three-phase busbar system size S00/S0

The three-phase busbar systems are finger-safe. They are designed for any short-circuit stress which can occur at the output side of connected motor starter protectors.

#### 8US busbar adapters for 60 mm systems

The motor starter protectors are mounted directly with the aid of busbar adapters on busbar systems with 60 mm center-to-center clearance in order to save space and to reduce infeed times and costs.

The busbar adapters for busbar systems with 60 mm center-to-center clearance are suitable for copper busbars with a width of 12 mm to 30 mm. The busbars can be 5 mm or 10 mm thick.

The motor starter protectors are snapped onto the adapter and connected on the line side. This prepared unit is then plugged directly onto the busbar system, and is thus connected both mechanically and electrically at the same time.

For further busbar adapters for snap-mounting direct-on-line starters and reversing starters as well as additional accessories such as line terminals and outgoing terminals, flat copper profile, etc., can be found in Section 5.

#### SIRIUS load feeders with busbar adapters snapped onto busbars

The three-phase busbar systems can also be used to construct "Type E Starters" according to UL/CSA. Special feeder terminals must be used for this purpose however (see "Selection and Ordering Data" on page 1/8).

## Busbar accessories

### Overview

#### Door-coupling rotary operating mechanisms

Motor starter protectors with a rotary operating mechanism can be mounted in a control cabinet and operated externally by means of a door-coupling rotary operating mechanism. When the cabinet door with motor starter protector is closed, the operating mechanism is coupled. When the motor starter protector closes, the coupling is locked which prevents the door from being opened unintentionally. This interlock can be defeated by the maintenance personnel. In the OPEN position, the rotary operating mechanism can be secured against reclosing with up to 3 padlocks. Inadvertent opening of the door is not possible in this case either.

## Accessories – Enclosures and front plates

### Overview

#### Enclosure

For stand-alone installation of motor starter protector size S2 ( $I_{n\ max} = 65\ A$ ), molded-plastic enclosures for surface mounting are available.

When installed in a molded-plastic enclosure the motor starter protectors have a rated operational voltage  $U_e$  of 500 V.

The molded-plastic enclosures are designed to degree of protection IP55.

Enclosures for surface mounting

All enclosures are equipped with N and PE terminals. There are two knock-out cable entries for cable glands at the top and two at the bottom; also on the rear corresponding cable entries are scored. There is a knockout on the top of the enclosure for indicator lights that are available as accessories.

In the enclosure for motor starter protector size S2 there is also room for the laterally mounted auxiliary release. There is no provision for installing a motor starter protector with a signaling switch.

The molded-plastic enclosures of the size S2 motor starter protectors are fitted with a rotary operating mechanism.

The enclosures can be supplied with either a black rotary operating mechanism or with an EMERGENCY-STOP rotary operating mechanism with a red/yellow knob.

The rotary operating mechanisms can be locked in the Open position with up to 3 padlocks.

#### Front plates

Motor starter protectors are frequently required to be actuated in any enclosure. Front plates equipped with a rotary operating mechanism for motor starter protector sizes S2 and S3 are available for this purpose.

## 3RV Spring-type terminal infeed system

### Design

#### Installation guidelines

Distance in Y direction from live, earthed or insulated parts according to IEC 60947-4: 10 mm.

In addition, the installation guidelines for motor starter protectors or fuseless load feeders including the clearances must be complied with.

<b>SIRIUS Contactor</b>	<b>Application</b> 0 = 3 pole Standard 2 = 3 pole Vacuum 3 = 4 pole NO 4 = 3 pole resistive load 5 = 4 pole 2 NO + 2 NC 6 = 3 pole Capacitive	<b>Frame</b> 5 = S6 6 = S10 7 = S12	<b>Current</b> Designation Choices = 4,5,6	<b>Terminal</b> 2 = Spring Loaded Coil only 6 = Busbar Terminal	<b>Coil Type</b> A = AC/DC (S6-S12) N = UC Solid state (S6-S12) P = UC Solid state with RLT (S6-S12)	<b>Coil Voltage</b> See Coil Selection Chart page 2/49	<b>Aux Contacts A)</b> 0 = None 4 = 2NO + 2NC (S6-S12) 5 = 1NO + 1 NC (S6-S12) 6 = 2 NO + 2 NC (S6-S12) A) per EN50012

**3RT2 SIRIUS Innovations Nomenclature**

3RT2	0	1	5	1	A	B0	1
<b>SIRIUS Innovations Contactor</b>	<b>Application</b> 0 = 3 pole Standard 3 = 4 pole NO 5 = 4 pole 2 NO + 2 NC 6 = 3-pole Capacitive	<b>Frame</b> 1 = S00 2 = S0 3 = S2 4 = S3	<b>Current</b> 3,4,5,6,7,8	<b>Terminal</b> 1 = Screw 2 = Spring Loaded 3 = Spring Loaded Coil only 4 = Ring Lug	<b>Coil Type</b> A = AC (S0-S3) B = DC N = UC Electronic	<b>Coil Voltage</b> See Coil Selection Chart page 2/49	<b>Aux Contacts A)</b> 0 = 1NO + 1NC (S0-S3) 1 = 1 NO (S00) 2 = 1 NC (S00) 4 = 2NO + 2NC (S00-S3) A) per EN50012

Note: MSPs and Contactors of the same frame size are made to easily fit together with the use of a link module or can be purchased pre-assembled as 3RA starter assemblies. See section 4.

Note: Contactors and Overloads of the frame size S00 - S3 are made to easily fit together without the use of accessories.

Note: This is only a guide to decode the model number. All possible combinations of these are not available.

## Contents

## SIRIUS contactor relays

**3RH21, 3RH22 control relays 4- and 8-pole, size S00, AC/DC operation**

Page

**Selection and ordering data**

- With screw connections 2/50
- With spring connections 2/50
- Accessories for 3RH2 2/51

Overview	2/14
Technical data	2/185
Terminal diagrams	2/202
Position of terminals	2/203
Dimension drawings	2/224

**3RH24 latched control relays, 4-pole, size S00, AC/DC operation**

Page

**Selection and ordering data**

- With screw connections 2/51
- Accessories for 3RH2 2/51

Application	2/116
Technical data	2/185

1) All terminals are spring loaded on frame sizes S00 & S0.  
 Only the coil terminals are spring loaded on frame sizes S2 & S3.  
 2) Max UL FLA = 65A at 460V

Note: Ring lug terminals are also available in size S00 & S0 contactors, except contactors with communication interface or UC coil. Change the 8th digit of the order number to a "4", e.g. 3RT2015-4AK61.

For further coil voltages, see page 2/49.  
 For auxiliaries and accessories, see page 2/66-2/83.  
 For spare parts, see page 2/94-2/99.

# Contactors for Special Applications

## 3RT23 contactors, 4-pole (4 NO contacts) for switching resistive loads (AC-1)

### Standards

IEC 60947-1, EN 60947-1  
 IEC 60947-4-1, EN 60947-4-1  
 IEC 60947-5-1, EN 60947-5-1 (auxiliary switches)

### Design

The contactors are suitable for use in any climate. They are safe from touch to DIN VDE 0106, Part 100. The accessories for the 3-pole SIRIUS contactors can also be used for the 4-pole designs.

#### Mountable auxiliary contacts

Size S00: 4 auxiliary contacts of which up to 3 can be NC.  
 Size S0 & S2: 4 additional auxiliary contacts up to 3 can be NC.  
 Sizes S2 and S3: Up to 4 auxiliary contacts (either laterally mounted or snapped onto the top).

#### Contactor assemblies with mechanical interlock

The 4-pole 3RT23 contactors with 4 NO contacts as the main contacts are suitable for making contactor assemblies with a mechanical interlock, e.g. for system transfers.

**Size S00:** Contactor assemblies can be made using two 3RT23.1 contactors in conjunction with the mechanical interlock and two connecting clips (Order No. 3RA2912-2H, pack comprising 10 interlocking elements and 20 clips for 10 contactor assemblies, see accessories on page 2/72).

**Size S0:** In order to make 4-pole contactor assemblies using two 3RT23.2 contactors, the fourth pole of the left-hand contactor must always be moved to the left-hand side. The contactor assembly can then be made easily with the aid of the 3RA2922-2H mechanical interlock and connecting clip set fitted between the two contactors.

**Sizes S2 and S3:** Contactor assemblies can be made using two 3RT23 3 or 3RT23 4 contactors in conjunction with the laterally mountable mechanical interlock and the mechanical connectors. The mechanical interlock for fitting onto the front cannot be used for size S2 and S3 contactors.

### Application

- Switching resistive loads
- Isolating systems with unearthed or poorly earthed neutral conductors
- System transfers when alternative AC power supplies are used
- As contactors which only carry current and do not have to switch in case of inductive loads – e.g. variable-speed operating mechanisms
- Switching mixed loads in distribution systems (e.g. for supplying heaters, lamps, motors, PC power supply units) with p.f. > 0.8 according to IEC 60947-4-1, test conditions for utilization category AC-1

# Contactors for Special Applications

## 3RT24, 3-pole for switching resistive loads (AC-1)

### Application

**AC and DC operation (size S3)**  
**UC operation (AC/DC)**  
 (sizes S6 to S12)

IEC 60 947, EN 60 947  
 (VDE 0660)

The contactors are suitable for use in any climate. They are safe from touch to DIN VDE 0106 Part 100.

3RT14/3RT24 contactors are used for switching resistive loads.

(AC-1) or as contactors, for example in variable-speed drives which normally only have to carry the current.

The accessories for the SIRIUS 3RT10/3RT20 contactors can also be used here.

# Contactors for Special Applications

## 3RT25 contactors, 4-pole (2 NO + 2 NC) contacts for switching motors

### AC and DC operation

IEC 60 947-4-1/EN 60 947-4-1  
(VDE 0660, Part 102)

### Design

The contactors are suitable for use in any climate. They are safe to touch according to EN 50274. The accessories for the 3-pole SIRIUS contactors can also be used for the 4-pole designs.

### Mountable auxiliary contacts

#### Size S00 and S0:

4 auxiliary contacts, of which up to 4 can be NC contacts.

#### Size S2

Up to 4 auxiliary contacts (either laterally mounted or snapped onto the top; auxiliary switch blocks to EN 50 012 and EN 50 005)

### Application

- Changing the polarity of hoisting gear motors
- Switching two separate loads from the same source

### Selection and ordering data

at 60 Hz: 0.85 ... 1.1 x  $U_s$   
4) The NC contact can switch up to 5 HP.

# 3RT, 3RH Contactors for Special Applications

## 3RH21 contactor relays

### Overview

#### DC operation

IEC 60947-4-1, EN 60947-4-1, for requirements according to IEC 60077-1 and IEC 60077-2.

The contactor relays are finger-safe according to EN 50274. The size S00 contactor relays have spring-type connections for all terminals.

#### Ambient temperature

The permissible ambient temperature for operation of the contactor relays (across the full coil operating range) is -40 to +70 °C.

Uninterrupted duty at temperatures > +60 °C reduces the mechanical endurance, the current carrying capacity of the conducting paths and the switching frequency.

#### Control and auxiliary circuits

The solenoid coils of the contactor relays have an extended coil operating range from 0.7 to 1.25 x  $U_s$  and are fitted as standard with suppressor diodes to provide protection against overvoltage. The opening delay is consequently 2 to 5 ms longer than for standard contactors.

### Application

For operation in installations which are subject both to considerable variations in the control voltage and to high ambient temperatures, e. g. railway applications under extreme climatic conditions, rolling mills, etc.

Also for control supply voltages with battery buffer for longer operating times should the battery charging fail.

#### Contactor relays without series resistor

##### Control and auxiliary circuits

These contactor relays have an extended operating range from 0.7 to 1.25 x  $U_s$ ; the solenoid coils are fitted with a suppressor diode. An additional series resistor is not required.

##### Note:

*An additional auxiliary switch block cannot be mounted.*

##### Side-by-side mounting

A clearance of 10 mm is required for side-by-side mounting at ambient temperatures > 60 °C ≤ 70 °C.

#### Contactor relays with series resistor

##### Control and auxiliary circuits

The DC solenoid systems of the contactor relays are modified (to hold-in coil) by means of a series resistor.

The size S00 contactor relays are supplied prewired with a plug-on module containing the series resistor. The suppressor diode is integrated.

A 4-pole auxiliary switch block (according to EN 50005) can be fitted additionally.

##### Side-by-side mounting

Side-by-side mounting is permitted at ambient temperatures up to 70 °C.

# 3RT, 3RH Contactors for Special Applications

## 3RT20 motor contactors, 7.5 ... 25 HP

### Overview

#### DC operation

IEC 60947-4-1, EN 60947-4-1, for requirements according to IEC 60077-1 and IEC 60077-2.

The contactors are finger-safe according to EN 50274. The contactors have spring-type connections as well as screw connections. The size S00 and S0 contactors have spring-type connections for all terminals.

#### Ambient temperature

The permissible ambient temperature for operation of the contactors (across the full coil operating range) is  $-40$  to  $+70$  °C.

Uninterrupted duty at temperatures  $> +60$  °C reduces the mechanical endurance, the current carrying capacity of the conducting paths and the switching frequency.

#### Control and auxiliary circuits

The solenoid coils of the contactor relays have an extended coil operating range from  $0.7$  to  $1.25$  or  $1.3 \times U_s$  and are fitted as standard with suppressor diodes. The opening delay is consequently  $2$  to  $5$  ms longer than for standard contactors.

### Application

For operation in installations which are subject both to considerable variations in the control voltage and to high ambient temperatures, e. g. railway applications under extreme climatic conditions, rolling mills, etc.

Also for control supply voltages with battery buffer for longer operating times should the battery charging fail.

#### Contactors without series resistor

##### Control and auxiliary circuits

These contactors have an extended operating range from  $0.7$  to  $1.25 \times U_s$ ; on size S00 the coils are fitted with suppressor diodes, on size S0 with varistors. An additional series resistor is not required.

##### Note:

*An additional auxiliary switch block cannot be mounted.*

##### Side-by-side mounting

A clearance of  $10$  mm is required for side-by-side mounting at ambient temperatures  $> 60$  °C  $\leq 70$  °C.

### 3RT20 1. contactors with series resistor

#### Control and auxiliary circuits

The solenoid coils of the contactors have an extended coil operating range from  $0.7$  to  $1.25 \times U_s$  and are fitted as standard with suppressor diodes to provide protection against overvoltage.

The DC solenoid systems of the contactors are modified (to holding excitation) by means of a series resistor.

The size S00 contactors are supplied prewired with a plug-on module containing the series resistor. The suppressor diode is integrated. A 4-pole auxiliary switch block (according to EN 50005) can be fitted additionally.

A circuit diagram showing the terminals is labeled on each contactor. One NC of the auxiliary contacts is required for the series resistor function. The selection and ordering data shows the number of additional, unassigned auxiliary contacts. With size S00 it is possible to extend the number of auxiliary contacts.

#### Side-by-side mounting

At ambient temperatures up to  $70$  °C, the size S00 contactors and contactor relays are allowed to be mounted side by side.

### 3RT20 2. contactors with solid-state operating mechanism, extended operating range

#### Control and auxiliary circuits

The solenoid coils of the contactors have an extended coil operating range from  $0.7$  to  $1.3 \times U_s$  and are fitted as standard with varistors to provide protection against overvoltage.

The contactors are energized via upstream control electronics which ensure the coil operating range of  $0.7$  to  $1.3 \times U_s$  at an ambient temperature of  $70$  °C. They are supplied as complete units with integrated coil electronics. A varistor is integrated for damping opening surges in the coil.

The mounting possibilities for auxiliary switches correspond to those of the standard contactors for switching motors in the matching size (see page 2/58).

#### Side-by-side mounting

Side-by-side mounting is permitted at ambient temperatures up to  $70$  °C for these contactor versions in size S0.

# Contactors for Special Applications

## 3RT26 capacitor contactors

### AC operation

IEC 60947-5, DIN EN 60947-5-1, (VDE 0660 Part 200)

The contactors are suitable for use in any climate and are finger safe per DIN EN 50274.

The 3RT26 capacitor contactors are application specific variants of the size S00 to S2 SIRIUS Innovations contactors. The capacitors are precharged by means of the mounted leading NO contacts and resistors; only then do the main contacts close.

This prevents disturbances in the power system and welding of the contactors.

Only discharged capacitors are permitted to be switched on with capacitor contactors. Recommendation: use discharge chokes for parallel connection with the capacitors.

The capacitor contactors of size S00 contain either 1NO or 1NC in the basic unit and another unassigned NC contact in the auxiliary switch block fitted to the basic unit.

The auxiliary switch block which is snapped onto the capacitor contactor of sizes S0 contains the three leading NO contacts and one standard NO contact, which is unassigned.

The capacitor contactors of size S2 can be fitted additionally with a 2-pole auxiliary switch on the right side (2 NO, 2 NC or 1 NO + 1 NC), type 3RH19 21-1EA.. for lateral mounting.

For the capacitor making and breaking capacity of the basic 3RT20 contactor variant, see the technical data.

## 3RT20 coupling contactors (interface) for switching motors, 3-pole

### AC and DC operation

IEC 60947, EN 60947.  
The 3RT20 coupling contactors for switching motors are tailored to the special requirements of working with electronic controls.

The 3RT20 1 coupling contactors cannot be expanded with auxiliary switch blocks.  
Coupling contactors have a low power consumption and an extended solenoid coil operating range.

Depending on the version, the solenoid coils are supplied either without overvoltage damping or with a diode, suppressor diode or varistor connected as standard.

# Contactors & Relays for Safety Applications

## 3RT, 3TF safety contactors and 3RH2, 3TH2 safety control relays

CONTACTORS AND ASSEMBLIES 2

### Applications

#### “Safety” Contactors

Safety rated contactors are required to have mirrored contact construction according to IEC 60947-4-1 Annex F. A mirror contact is a Normally Closed (NC) auxiliary contact which can not be closed simultaneously with a Normally Open (NO) main contact.

In some industries, such as automotive, requirements have been established that a safety rated contactor must also have permanently mounted auxiliary contact blocks. See page 2/23 for Contactors with permanently mounted auxiliary contacts.

#### Siemens Contactors for “Safety” applications:

All Siemens standard 3RT, 3TF6, 40HN & 40PH Contactors are provided with positively driven (mirror) contacts which meet or exceed the criteria for “Safety Contactors” according to IEC 60947-4 Annex F which describes the requirements for mirror contact performance.

When applying Safety Contactors in safety circuits, the NC auxiliary contacts must be wired in series or parallel and must be used as monitoring contacts with feedback to the safety evaluation device (i.e. safety relay or failsafe logic controller).

#### “Safety” Control Relays

Safety rated control relays are required to have positively driven contact elements according to IEC 60947-5-1 Annex L. Positively driven contact elements are a combination of NO auxiliary contacts and NC auxiliary contacts whose construction prevents them from being closed simultaneously.

In some industries, such as automotive, requirements have been established that a safety rated control relays must also have permanently mounted auxiliary contact blocks. See page 2/18 for Control Relays with permanently mounted auxiliary contacts.

#### Siemens Control Relays for “Safety” applications:

All SIRIUS 3RH control relays (with at least 1 NC contact) meet or exceed the criteria for “Safety Control Relays” according to IEC 60947-5-1 Annex L. This is true for the basic 3RH relay with or without an additional auxiliary contact block.

# Contactors & Relays for Safety Applications

3RT safety contactors, 3RH2 safety control relays with permanently mounted auxiliary contact blocks

## Application

### "Safety" Contactors

Safety rated contactors are required to have mirrored contact construction according to IEC 60947-4 Annex F. A mirror contact is a Normally Closed (NC) auxiliary contact which can not be closed simultaneously with a Normally Open (NO) main contact. In some industries, such as Automotive, the auxiliary contact blocks are required to be permanently attached to meet the requirements of "unintentional misuse" as specified in IEC 60292, paragraph 3.12. Tested by SUVA.

3RT202\* -1AK64-3MA0

### "Safety" Control Relays

Safety rated control relays are required to have positively driven contact elements according to IEC 60947-5-1 Annex L. Positively driven contact elements are a combination of NO auxiliary contacts and NC auxiliary contacts whose construction prevents them from being closed simultaneously. In some industries, such as automotive, the auxiliary contact blocks are required to be permanently attached to meet the requirements of "unintentional misuse" as specified in IEC 60292, paragraph 3.12. Tested by SUVA.

For accessories, see pages 2/73-2/78.

For spare parts, see pages 2/94-2/97.

For technical data, see pages 2/121-2/142.

For description, see pages 2/104-2/105.

For int. circuit diagrams, see page 2/190-2/196.

For dimension drawings, see pages 2/209-2/215.

1) All terminals are spring loaded on frame size S00 and S0.

Only the coil and auxiliary contact terminals are spring loaded on frame sizes S2 & S3.

2) For AC-15/AC-14, max current for front mounted auxiliary contacts = 6 A.

3) The 3RH22 control relays are also available with ring lug terminals. Replace the 8th digit of the order number with a "4", e.g. 3RH2244-4AK60

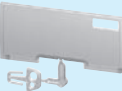

4) Max UL FLA = 65A at 460V

# Function Modules for Mounting onto SIRIUS 3RT2 Contactors

## Introduction

### Overview

The function modules for mounting onto contactors enable the assembly of starters and contactor assemblies for direct-on-line, reversing and wye-delta starting without any additional, complicated wiring of the individual components. They include the key control functions required for the particular starter, e. g. timing and interlocking, and can be connected to the control system by either parallel wiring or through IO-Link or AS-Interface.

Version	SIRIUS function modules for parallel wiring	SIRIUS function modules for IO-Link <sup>1)</sup>	SIRIUS function modules for AS-Interface <sup>1)</sup>

<sup>1)</sup> Use of the communication-capable function modules for IO-Link or AS-Interface requires contactors with communication interface (see pages 2/26).

<sup>2)</sup> The modules for the control current wiring, which are included in the wiring kit, are not required.

*Note:*  
When the function modules are used, no other auxiliary switches are allowed to be mounted on the basic units.

# Function Modules for Mounting onto SIRIUS 3RT2 Contactors

## SIRIUS function modules

### Overview

Simply by being plugged in place, the SIRIUS function modules enable different functionalities required for the assembly of starters to be realized in the starter. The function modules and wiring kits help to reduce the wiring work within the starter practically to zero.

#### SIRIUS function modules for direct-on-line starting

The electronic timing relays which can be mounted onto the contactor are available in these versions:

- Sizes S00 and S0 for applications in the range from 24 to 240 V AC/DC (wide voltage range)
- Size S2 for applications in either the range from 24 to 90 V AC/DC or 90 to 240 V AC/DC

Both the electrical and mechanical connection are made by simple snapping on and locking.

A protection circuit (varistor) is integrated in each module.

The electronic timing relay with semiconductor output uses two contact legs to actuate the contactor underneath by means of a semiconductor after the set time  $t$  has elapsed.

The switching state feedback is performed by a mechanical switching state indicator (plunger). In addition, the auxiliary switches in the contactors are freely accessible and can be used for feedbacks to the control system or for signal lamps.

A sealable cover is available to protect against careless adjustment of the set times.

#### SIRIUS function modules for reversing starting

The wiring kits for reversing starters enable the cost-effective assembly of contactor assemblies. They can be used for all applications with reversing duty up to 50 HP.

For a detailed description see page 2/37.

#### SIRIUS function modules for wye-delta starting

Both interlocking and timing functions are required for the assembly of wye-delta starters. With the function modules for wye-delta starting and the matching link modules for the main circuit, these starters can be assembled easily and with absolutely no errors.

The entire sequence in the control circuit is integrated in the snap-on modules. This covers:

- An adjustable wye time  $t$  from 0.5 to 60 s
- A non-adjustable dead interval of 50 ms
- Electrical contacting to the contactors by means of coil pick-off (contact legs)
- Feedback of the switching state at the contactor using a mechanical switch position indicator (plunger)
- Electrical interlocking between the contactors

These modules do not require their own terminals and can therefore be used for contactors with both screw and spring-type terminals in the S00, S0 and S2. To start the wye-delta starter, only the first of the three contactors (line contactor) is actuated. All other functions then take place inside the individual modules.

This also offers advantages if the timing function was previously implemented in a controller, as it again results in a significant reduction in the number of PLC outputs, the programming work and the wiring outlay.

The kits for the main circuit include the mechanical interlock, the star jumper, the wiring modules at the top and at the bottom, and the required connecting clips.

A protection circuit (varistor) is integrated in the basic module.

### Application

The snap-on function modules for direct-on-line starting are used above all for realizing timing functions independently of the control system.

With the OFF-delay variant of the timing relay it is possible for example for the fan motor for cooling a main drive to be switched off with a delay so that sufficient cooling after operation is guaranteed even if the plant and its control system have already been switched off.

The ON-delay timing relays enable for example the time-delayed starting of several drives so that the summation starting current does not rise too high, which could result in voltage failure.

The function modules for wye-delta starting are mostly used where current-limiting measures for starting a drive are required, e.g. for large fans and ventilators, and a high level of availability is essential at the same time. This technology has been used with success for several decades and has the additional advantage of requiring relatively little know-how. Through the use of function modules, the assembly work with simple standard components is even easier and error-free.

### Benefits

The use of snap-on function modules for direct-on-line starting (timing relays) results in the following advantages:

- Reduction of control current wiring
- Prevention of wiring errors
- Reduction of testing costs
- Implementation of timing functions independently of the control system
- Less space required in the control cabinet compared to a separate timing relay
- No additive protection circuit required (varistor integrated)

The use of function modules for wye-delta starting results in the following advantages:

- Operation solely through the line contactor A1/A2 – no further wiring needed
- Reduction of the control current wiring inside the contactor assembly and to the higher-level control system where applicable
- Prevention of wiring errors
- Reduction of testing costs
- Integrated electrical interlocking saves costs and prevents errors
- Less space needed in the control cabinet compared to using a separate timing relay
- Adjustable starting in star mode from 0.5 to 60 s
- Independent of the contactor's control supply voltage (24 to 240 V AC/DC)
- Varistor integrated – no additive protection circuit required
- No control current wiring thanks to plug-in technology and connecting cables
- Mechanically coded assembly enables easy configuration and reliable wiring
- Fewer versions – one module kit for screw and spring-type connection and for the two sizes S00 to S2
- Mechanical interlocking (with wiring kit for the main circuit)

# Contactors for Switching Motors

## 3RT2 contactors, 3-pole – Communication Contactors

### Selection and ordering data

- Ideal for diagnostics to the automation controller
- Quickly locate and rectify faults
- Configuration available in Step 7 and TIA Portal
- Easy engineering of parameters
- For DOL, reversing and wye delta starters up to 50 HP
- Manual starter operation with optional operator panel
- Reduces control wiring in the panel
- Available for 24VDC control systems
- Easily snap on IO-Link or AS-Interface modules onto contactors

1) All terminals are spring loaded in sizes S00 and S0.  
For size S2, only the coil and aux contacts are spring loaded.

Communication capable contactors are ideal for starter feedback to the automation level. IO-Link starters in the cabinet save considerable wiring effort. AS-Interface is best suited for distributed systems.

# Function Modules for Mounting onto SIRIUS 3RT2 Contactors

## SIRIUS function modules for IO-Link

### Overview

The SIRIUS function modules for IO-Link enable the assembly of starters and contactor assemblies for direct-on-line, reversing and wye-delta starting without any additional, complicated wiring of the individual components. They include the key control functions required for the particular starter, e. g. timing and interlocking. The electrical and mechanical connection to the contactor is established by snapping on and locking. An additive protection circuit for the individual contactors can be dispensed with completely, and feedback from the contactor contacts is performed with Hall sensors which provide reliable feedback concerning the switching state even under extremely dusty conditions. The starters are connected to the higher-level

control system through IO-Link, with the possibility of connecting up to four starters as a group to one port of the IO-Link master.

Through this type of connection to the control system, a maximum of wiring is saved. The following essential signals are transmitted:

- Availability of the starter in response to an indirect inquiry from the motor starter protector
- Starter operation
- Feedback concerning the switching state of the starter

Signal transmission through IO-Link

The inquiry from the motor starter protector does not take place through additional wiring between the auxiliary switch and the module but by means of a voltage inquiry at the contactor input.

This requires the use of communication versions of the contactors with communication interface (see page 2/26).

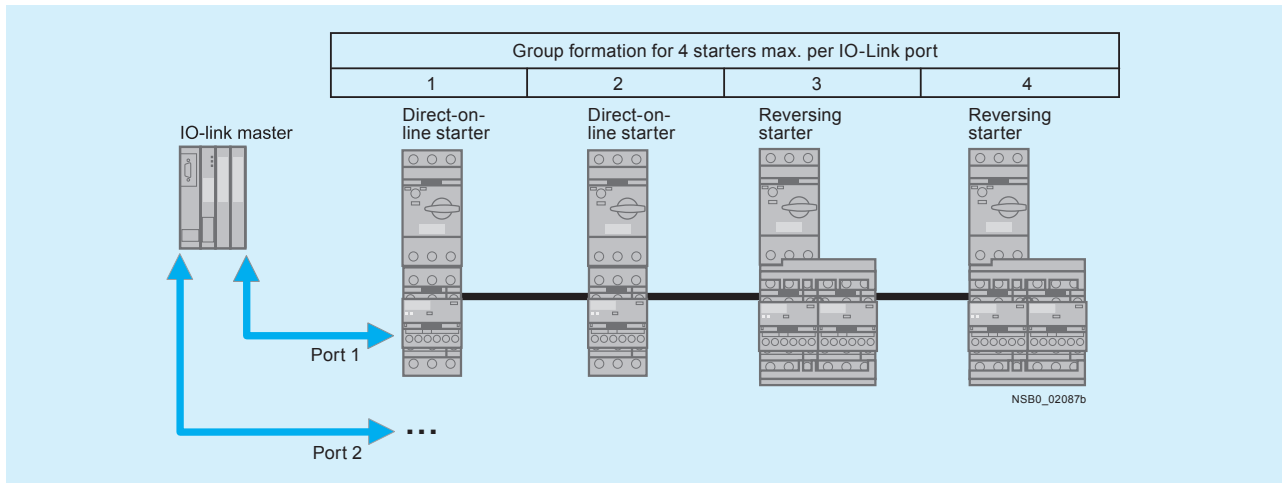

Availability signal through voltage pick-off

# Function Modules for Mounting onto SIRIUS 3RT2 Contactors

## SIRIUS function modules for IO-Link

By grouping up to four starters it is possible to connect up to 16 starters to one master of the ET200S. All the signals of the individual controls are made available through only 3 individual wires per starter group directly in the process image. If the

potential at the master of the ET200S is the same as that of the controls, a further reduction in wiring is possible by providing the control supply voltage to the contactors by jumpering the corresponding communication wires.

Group formation with IO-Link

In case of a malfunction, the corresponding error signals are also sent directly to the PLC in acyclic mode. This is in addition to transmission of the switching signals and status signals.

Possible error signals:

- Device defect
- No main voltage (motor starter protector tripped)
- No control supply voltage
- Limit position on the right / on the left
- Manual mode
- Process image fault

This easy integration of the starters in the TIA world does not limit the flexibility in the field in the least. For example, all function modules have special terminals in order to enable direct local disconnection. These terminals can be connected for example to a position switch. The input interrupts the voltage supply to the contactor coil directly, i. e. without going through the PLC. These terminals are jumpered in the as-delivered state.

Local manual operation of the complete starter group is also straight-forward using an operator panel. The latter is easily connected to the last starter and can be built into the front panel of the control cabinet if required. This offers significant advantages particularly for commissioning.

### Application

The use of SIRIUS function modules with IO-Link is recommended above all in machines and plants in which there are several motor starters in one control cabinet. Using IO-Link, the connection of these starters to the automation level is easy, quick and error-free. And with IO modules no longer needed, the width of the ET200S becomes far smaller.

### Benefits

- Reduction of the control current wiring to no more than one cable having three conductors for four starters
- Elimination of testing costs and wiring errors
- Reduction of configuration work
- Integration in TIA for clear diagnostics if a fault occurs
- Fewer IO modules saves space in the control cabinet
- All essential timing and interlocking functions for reversing duty and wye-delta starting are integrated
- No additional control circuit required

Further information on the application and benefits of the SIRIUS function modules for connection to the control system through IO-Link can be found in Chapter 14 "Industrial Communication".

# Function Modules for Mounting onto SIRIUS 3RT2 Contactors

## SIRIUS function modules for AS-Interface

CONTACTORS AND ASSEMBLIES 2

### Overview

The SIRIUS function modules for AS-Interface enable the assembly of starters and contactor assemblies for direct-on-line, reversing and wye-delta starting without any additional, complicated wiring of the individual components. They include the key control functions required for the particular starter, e. g. timing and interlocking. The electrical and mechanical connection to the contactor is established by snapping on and locking. An additional control circuit for the individual contactors can be eliminated with completely because a varistor is integrated in the modules. Feedback from the contactor contacts is performed with Hall sensors which provide reliable feedback concerning the switching state even under extremely dusty conditions. Connection of the starters to the higher-level control system takes place through AS-Interface with the Specification V2.1 in A/B technology. As the result, up to 62 starters can be con-

nected to one master and the address is entered in normal manner with an addressing unit.

Through the AS-Interface connection to the control system, a maximum of wiring is saved. The wiring outlay is reduced to the control supply voltage and the two individual wires for AS-Interface.

The following essential signals are transmitted:

- Availability of the starter in response to an indirect inquiry from the motor starter protector
- Starter operation
- Feedback concerning the switching state of the starter

Signal transmission through AS-Interface

The inquiry from the motor starter protector does not take place through additional wiring between the auxiliary switch and the module but by means of a voltage inquiry at the contactor input.

This requires use of communication versions of the contactors with communication interface (see page 2/26).

Availability signal through voltage pick-off

# Function Modules for Mounting onto SIRIUS 3RT2 Contactors

## SIRIUS function modules for AS-Interface

Topology with AS-Interface

This easy integration of the starters in the TIA world does not limit the flexibility in the field in the least. For example, all function modules have special terminals in order to enable direct local disconnection. These terminals can be connected for example,

to a position switch. The input interrupts the voltage supply to the contactor coil directly, i. e. without going through the PLC. These terminals are jumpered in the as-delivered state.

### Application

The use of SIRIUS function modules with AS-Interface is recommended above all in machines and plants requiring easy connection of several different sensors and actuators both inside and outside the control cabinet to the higher-level control system. And with IO modules no longer needed, the width of the PLC is far smaller.

### Benefits

- Reduction of control current wiring
- Elimination of testing costs and wiring errors
- Reduction of configuration work
- Elimination of IO modules saves space in the control cabinet
- All essential timing and interlocking functions for reversing duty and wye-delta starting are integrated
- No additional control circuit required

# Contactors Assemblies for Switching Motors

## 3RA reversing contactor assemblies

### Design

#### Complete equipment assemblies

The fully wired reversing contactor assemblies are suitable for use in any climate. They are safe from touch to EN 50274.

The contactor assemblies each consist of two contactors with identical ratings. The contactors are mechanically and electrically interlocked (NC contact interlock). The main and control circuits are wired according to the circuit diagrams on page 2/199.

For motor protection, either 3RU2 or 3RB3 overload relays for direct mounting or individual mounting or thermistor motor protection tripping units must be ordered separately.

#### Components for customer assembly

Installation kits for all sizes are available for customer assembly of reversing contactor assemblies.

Contactors, overload relays, the mechanical interlock and — for momentary-contact operation — auxiliary switch blocks for latching must be ordered separately

The following points should be noted:

#### Size S00

- For maintained-contact operation: use contactors with an NC contact in the basic unit for the electrical interlock.
- For momentary-contact operation: use contactors with an NC contact in the basic unit for the electrical interlock; in addition, an auxiliary switch block with at least one NO contact for latching is required per contactor.

#### Size S0 and S2

Contactors come equipped with integrated 1 NO and 1 NC aux contacts in each contactor. Both electrical interlocking and latching are satisfied with the integrated auxiliaries. Mechanical interlocking is required in either size and comes in the assembly kits except for size S2 where you need to order 3RA2934-2B interlock separately.

#### Sizes S3

- For maintained-contact operation: the contactors have no auxiliary contact in the basic unit; NC contacts for the electrical interlock are therefore integrated in the mechanical interlock that can be mounted on the side of each contactor (one contact each for the left and right-hand contactors).
- For momentary-contact operation: the electrical interlock is the same as for maintained-contact operation; in addition, an auxiliary switch with one NO contact for latching is required per contactor. This contact can be snapped onto the top of the contactors. Alternatively, auxiliary switch blocks mounted on the side can be used; they must be fitted onto the outside of each contactor.

If the front-mounted mechanical interlock is used for size S2 to S3 contactors, two location holes for single-pole auxiliary switch blocks are provided on the front of each S2 contactor while three additional, single-pole auxiliary switch blocks can be snapped onto S3 contactors. The maximum auxiliary switch complements per contactor stated on page 2/12 must not be exceeded.

When size S3 contactors are combined with a front-mounted mechanical interlock, the 3RA19 33-2B and 3RA19 43-2B installation kits cannot be used.

#### Sizes S6 to S12

To insert the mechanical interlock, the prestamped location holes positioned opposite on the contactor must be knocked out. The internal auxiliary contacts (up to 1 NO + 1 NC per contactor) can be used for the electrical interlock and latching. The mechanical interlock itself does not contain any auxiliary contacts. Additional auxiliary contacts can be used on the outside and front (on the front in the case of 3RT10) of the reversing contactor assembly.

### Principle of operation

The operating times of the individual 3RT10/20 contactors are rated in such a way that no overlapping of the contact making and the arcing time between two contactors can occur on reversing, providing they are interlocked via their auxiliary switches (NC contact interlock) and the operating mechanisms. An additional dead interval of 50 ms is necessary on reversing if the individual contactors are used at voltages > 500 V. The operating times of the individual contactors are not affected by the mechanical interlock.

### Surge suppression

#### Sizes S00 to S3

All contactor assemblies can be fitted with RC elements or varistors for damping opening surges in the coil.

As with the individual contactors, the surge suppressors can either be plugged onto the front of the contactors (S00) or fitted onto the coil terminals on the top or bottom (S3). For sizes S0 and S2, the surge protection fits behind the hinged door on the front of the contactor and does not take up any additional space.

#### Sizes S6 to S12

The contactors are fitted with varistors as standard.

# Contactors and Contactor Assemblies for Switching Motors

## 3RA13 and 3RA23 reversing contactor assemblies

### Overview

The 3RA13 and 3RA23 reversing contactor assemblies can be ordered as follows:

#### Sizes S00 to S3

- Fully wired and tested, open type, with mechanical and electrical interlock. 1)

#### Sizes S00 to S12

- As components for customer assembly.

There is also a range of accessories (auxiliary switch blocks, surge suppressors, etc.) that must be ordered separately.

For overload relays for motor protection, see section 3.

The 3RA23 and 3RA13 contactor assemblies have screw connections and are available for screwing or snapping onto 35 mm standard mounting rails. The 3RA23 contactor assemblies are also available with spring-type terminals.

The Ⓒ and Ⓓ approvals only apply to the complete contactor assemblies and not to the components for customer assembly.

#### AC and DC operation

See pages 2/40 through 2/44 for complete part numbers.

For accessories, see page 2/80-2/83.  
 For circuit diagrams, see page 2/199.  
 For dimension drawings, see page 2/218-2/220.

- 1) An additional dead interval of 50 ms is necessary on reversing at voltages > 500 V.
- 2) Laterally mountable with one auxiliary contact (except no auxiliary contact in S2 & S3)
- 3) For front mounting with one auxiliary contact.
- 4) Laterally mountable without auxiliary contact.
- 5) Interlock must be ordered with installation kit.
- 6) Installation kit contains: mechanical interlock; 2 connecting clips for 2 contactors; wiring connectors on the top and bottom.
- 7) Installation kit contains: 2 connecting clips for 2 contactors; wiring connectors on the top and bottom and the mechanical interlock.
- 8) Installation kit contains: 2 connecting clips for 2 contactors; wiring connectors on the top and bottom.
- 9) Installation kit contains: wiring connector on the top and bottom.

# 3RA24 Contactor Assemblies for Wye-Delta Starting

3RA24 complete units, 5.5 ... 22 kW

## Overview

These 3RA24 contactor assemblies for wye-delta starting are designed for standard applications.

**Note:**

*Contactor assemblies for wye-delta starting in special applications such as very heavy starting or wye-delta starting of special motors must be customized. Help with designing such special applications is available from Technical Assistance.*

The 3RA24 contactor assemblies for wye-delta starting can be ordered as follows:

**Sizes S00 and S0**

- Fully wired and tested, with electrical and mechanical interlock.
- As individual parts for customer assembly.

A dead interval of 50 ms on reversing is already integrated in the function module for wye-delta starting.

There is also a range of accessories (lateral auxiliary switch blocks, etc.) that must be ordered separately.

[For overload relays for motor protection see Chapter 3 "Overload Relays" --> "3RB3 Solid-State Overload Relays".](#)

The 3RA24 contactor assemblies have screw or spring-type terminals and are suitable for screwing or snapping onto TH 35 standard mounting rails.

With the fully wired and tested 3RA24 contactor assemblies, the auxiliary contacts included in the basic devices are unassigned.

## Motor protection

Overload relays or thermistor motor protection releases can be used for overload protection.

The overload relay can be either mounted onto the line contactor or separately fitted. It must be set to 0.58 times the rated motor current.

## Surge suppression

Sizes S00 and S0

Surge suppression (varistor) is included in the function modules for wye-delta starting.

## Function modules for wye-delta starting

The 3RA28 16-0EW20 wye-delta function module ([see page 2/27](#)) replaces the complete wiring in the control circuit and can be used in the voltage range from 24 to 240 V AC/DC. It is snapped onto the front of the contactor assembly size S00 or S0.

One function module comprises a complete module kit:

- One 3RA29 12-0 basic module with integrated control logic and time setting,
- And two 3RA29 11-0 coupling modules with related connecting cables.

The scope of supply comprises a complete module kit for one contactor assembly for wye-delta starting size S00 or S0, regardless of the connection method.

# 3RA24 Contactor Assemblies for Wye-Delta Starting

3RA24 complete units, 5.5 ... 22 kW

CONTACTORS AND ASSEMBLIES 2

### Components for customer assembly

Assembly kits with wiring modules and mechanical connectors are available for contactor assemblies for wye-delta starting. Contactors, overload relays, function modules for wye-delta starting or wye-delta timing relays, auxiliary switches for electrical interlock – if required also feeder terminals and base plates – must be ordered separately.

The wiring kits for sizes S00 and S0 contain the top and bottom main conducting path connections between the line and delta

contactors (top) and between the delta and star contactors (bottom).

### Control circuit

Features:

- Time setting range 0.5 to 60 s (3 selectable settings)
- Wide voltage range 24 to 240 V AC/DC
- Dead interval of 50 ms, non-adjustable.

### Screw terminals

# Control Relays, Coupling Relays

## 3RH24 latched control relays, 4-pole

### Overview

The contactor coil and the coil of the release solenoid are both designed for uninterrupted duty.

The number of auxiliary contacts can be extended by means of front auxiliary switch blocks (up to 4 poles).

RC elements, varistors diodes or diode assemblies can be fitted to both coils from the front for damping opening surges in the coil.

# Coupling Relays

## 3RH21 coupling relays for switching auxiliary circuits, 4 pole

### Application

#### DC operation

IEC 60 947 and EN 60 947

The 3RH21 coupling relays for switching auxiliary circuits are tailored to the special requirements of working with electronic controls.

The 3RH21 coupling relays cannot be extended with auxiliary switch blocks.

Coupling relays have a low power consumption, an extended coil voltage tolerance and an integrated surge suppressor for damping opening surges on select versions

### Selection and ordering data

### Accessories and Spare parts for 3TF68 and 3TF69 vacuum contactors

#### Selection and ordering data

Details	For contactor type	Order No.	Weight approx. kg
<b>Coils</b>			
<b>AC Operation</b>			
The coils are fitted with varistors for damping surges as standard; the coil is supplied with the closing electronics included.	3TF68	<b>3TY7683-0C●●</b>	0.65
	3TF69	<b>3TY7693-0C●●</b>	
<b>DC Operation</b>			
Reversing contactors are required for size 14 contactors:			
Contactor type    Reversing contactor type	3TF68	<b>3TY7683-0D●●</b>	0.56
3TF68 and 3TF69:    3TC44 (70 mm wide, 85 mm high)	3TF69	<b>3TY7693-0D●●</b>	
The coils are supplied without a reversing contactor.			
●● For rated control supply voltages, see page 2/102.			
<b>Vacuum interrupters</b>			
<b>In order to ensure reliable operation of the contactors, only Siemens original replacement interrupters should be used.</b>			
3 vacuum interrupters with mounting parts per set.	3TF68	<b>3TY7680-0B</b>	3.2
	3TF69	<b>3TY7690-0B</b>	3.5
<b>Auxiliary switch blocks with screw terminals</b>			
1 NO and 1 NC	First auxiliary switch block, left or right. Replacement type for: 3TY7561-1A, -1B	3TF68 / 3TF69	<b>3TY7561-1AA00</b> 0.042
1 NO and 1 NC	First auxiliary switch block, left or right late break	3TF68 / 3TF69	<b>3TY7561-1EA00</b> 0.042
1 NO and 1 NC	Second auxiliary switch block, left or right. Replacement type for: 3TY7 561-1K, -1L	3TF68 / 3TF69	<b>3TY7561-1KA00</b> 0.042
<b>Auxiliary switches for coil reconnection, for DC economy circuit with screw connections</b>			
1 NC	Auxiliary switch block late break	3TF68 / 3TF69	<b>3TY7681-1G</b> 0.042
<b>Solid-state compatible auxiliary switch block with screw terminals</b>			
	For mounting onto the side of contactors. For use in dusty atmosphere and electronic circuits with rated operational currents <i>I<sub>e</sub></i> AC-14 and DC-13 from 1 mA to 300 mA at 3 V to 60 V.	3TF68 / 3TF69	<b>3TY7561-1UA00</b> 0.042

3TY7

3TY7561-1.

For accessories, see page 2/53-2/54.  
 For technical data, see page 2/172-2/177.  
 For description, see page 2/117.  
 For internal circuit diagrams, see page 2/211.  
 For position of terminals, see page 2/208  
 For dimension drawings, see page 2/221.

1) For further voltages, see page 2/102.  
 2) Surge suppression integrated: fitted with varistor.  
 3) For EMC, see description on page 2/117.  
 3TF68/69 vacuum contactors are supplied with integrated surge suppression for the main conducting paths (for description, see page 2/117). In operation in circuits with DC choppers, frequency converters, variable-speed drives, for example, this protective circuitry is not required. It might be damaged by voltage peaks and harmonics generated, possibly followed by phase-to-phase shortcircuits. For this reason, the contactors can be supplied without overvoltage damping. To order these versions add a "-Z" and the order code "A02".

### Terminal covers

3TX6 506-3B

6	3TC48	For protection against inadvertent contact with exposed busbar connections. Can be screwed on free screw end. Covers one busbar connection		<b>3TX6 506-3B</b>	1 set= 6 units
10 and 14	3TC52, 3TC56			<b>3TX6 546-3B</b>	1 set= 6 units

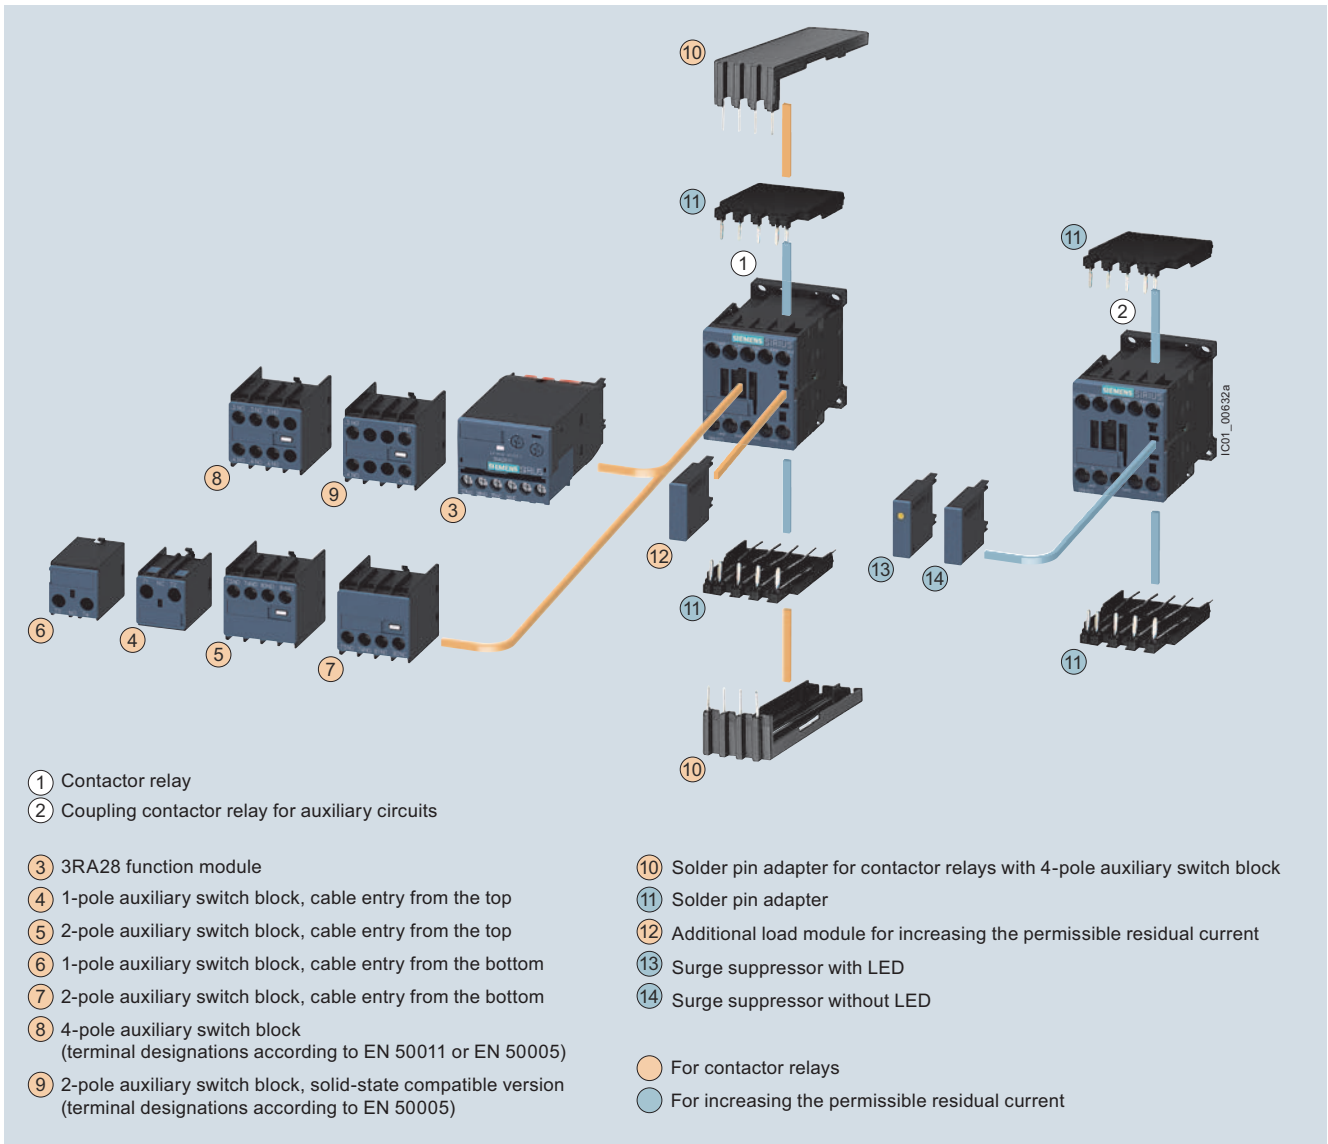

<sup>1)</sup> The connection piece for mounting the surge suppressor must be bent slightly.

<sup>2)</sup> Includes the peak value of the alternating voltage on the DC side.

<sup>3)</sup> Not for DC economy circuit.

Contactor relays and coupling relays – Size S00 with accessories

3RT2 contactors and coupling relays – Size S00 with mountable accessories

Overview

The SIRIUS family of controls

The SIRIUS modular system with its components for the switching, starting, protection and monitoring of motors and industrial systems stands for the fast, flexible and space-saving construction of control cabinets.

3RT2 contactors  
Size S00 with mountable accessories

① Contactor size S00

- ② 2-pole auxiliary switch block, laterally mountable
- ③ 1-pole auxiliary switch block, for snapping onto the front cable entry from the top
- ④ 2-pole auxiliary switch block, for snapping onto the front cable entry from the bottom
- ⑤ 4-pole auxiliary switch block, for snapping onto the front
- ⑥ 3RA28 function module
- ⑦ 3RA27 function module for AS-Interface, direct starting
- ⑧ 3RA27 function module for IO-Link, direct starting
- ⑨ Surge suppressor with/without LED
- ⑩ Three-phase feeder terminal

- ⑪ Star jumper, 3-pole, without connecting terminal
- ⑫ Link for paralleling, 3-pole, with connecting terminal
- ⑬ Solder pin adapter
- ⑭ Connection module (adapter and connector) for contactors with screw-type connection
- ⑮ Safety main current connector for two contactors

Assembly kit 3RA2913-2AA1 comprising:

- ⑯ Wiring modules on the top and bottom for connecting the main, auxiliary and control current paths, electrical interlock<sup>1)</sup> included (NC contact interlock), can be broken off (NC contact interlock)
- ⑰ Mechanical interlocks<sup>2)</sup>
- ⑱ Two connecting clips for two contactors<sup>2)</sup>

- For contactors
- For contactors and coupling contactors

<sup>1)</sup> 3RT201. contactors with one NC contact in the basic unit are required for the electrical interlock. An additional NO contact is required for momentary-contact operation.

<sup>2)</sup> The parts ⑰ and ⑱ can only be ordered together as 3RA2912-2H mechanical connectors.

3RT2 contactors and coupling relays – Size S0 with mountable accessories

**3RT2 contactors**  
Size S0 with mountable accessories

- ① Contactor size S0
  - ② 2-pole auxiliary switch block, laterally mountable
  - ③ 1-pole auxiliary switch block, for snapping onto the front cable entry from the top
  - ④ 4-pole auxiliary switch block, for snapping onto the front cable entry from the bottom
  - ⑤ 2-pole auxiliary switch block, for snapping onto the front cable entry from the bottom
  - ⑥ Surge suppressor with/without LED
  - ⑦ 3RA27 function module for AS-Interface, direct starting
  - ⑧ 3RA28 function module
  - ⑨ 3RA27 function module for IO-Link, direct starting
  - ⑩ Pneumatically delayed auxiliary switch block
  - ⑪ Mechanical latching block
  - ⑫ Link for paralleling, 3-pole, with connecting terminal
  - ⑬ Connection module (adapter and plug) for contactors with screw-type connection
  - ⑭ Coil terminal module, on the top and bottom
  - ⑮ Three-phase feeder terminal
  - ⑯ Link for paralleling (star jumper), 3-pole, without connecting terminal
  - ⑰ Safety main current connector for two contactors
- Assembly kit 3RA2923-2AA1 comprising:
- ⑱ Wiring modules on the top and bottom for connecting the main current paths, electrical interlock included (NC contact interlock)
  - ⑲ Mechanical interlocks<sup>1)</sup>
  - ⑳ Two connecting clips for two contactors<sup>1)</sup>
- For contactors  
● For contactors and coupling contactors

1) The parts ⑲ and ⑳ can only be ordered together as 3RA2912-2H mechanical connectors.

3RT2 contactors – Size S2 with mountable accessories

① Contactor, size S2

- ② 2-pole auxiliary switch block, laterally mountable
- ③ 1-pole auxiliary switch block, for snapping onto the front, cable entry from above
- ④ 4-pole auxiliary switch block, for snapping onto the front
- ⑤ 2-pole auxiliary switch block, for snapping onto the front, cable entry from below
- ⑥ Surge suppressor with/without LED
- ⑦ 3RA27 function modules for AS-Interface, direct-on-line starting
- ⑧ 3RA28 function modules
- ⑨ 3RA27 function modules for IO-Link, direct-on-line starting
- ⑩ Link for paralleling, 3-pole, with connection terminal
- ⑪ Coil terminal module, top and bottom
- ⑫ Three-phase feeder terminal

- ⑬ Link for paralleling (star jumper), 3-pole, without connection terminal
- ⑭ Safety main current connector for two contactors

Assembly kit 3RA2933-2AA1 comprising:

- ⑮ Wiring modules on the top and bottom for connecting the main current paths, electrical interlock included (NC contact interlock)
- ⑯ Two connecting clips for two contactors

To be ordered separately:

- ⑰ Mechanical interlocks

Accessories see pages 2/66 to 2/81.

3RT2 contactors – Size S3 with mountable accessories

① Contactor, size S3

- ② 2-pole auxiliary switch block, laterally mountable
- ③ 1-pole auxiliary switch block, for snapping onto the front, cable entry from above
- ④ 4-pole auxiliary switch block, for snapping onto the front
- ⑤ 2-pole auxiliary switch block, for snapping onto the front, cable entry from below
- ⑥ Surge suppressor with/without LED
- ⑦ 3RA27 function modules for AS-Interface, direct-on-line starting
- ⑧ 3RA28 function modules
- ⑨ 3RA27 function modules for IO-Link, direct-on-line starting

- ⑩ Links for paralleling, 3-pole, with connection terminal
- ⑪ Coil terminal module, top and bottom
- ⑫ Single-phase infed terminals (3 units)
- ⑬ Links for paralleling (star jumper), 3-pole without connecting terminal

Assembly kit 3RA2943-2AA1 comprising:

- ⑭ Wiring modules on the top and bottom for connecting the main, auxiliary and control current paths, electrical interlock<sup>1)</sup> included, can be broken off (NC contact interlock)
- ⑮ Two connectors for two contactors

To be ordered separately:

- ⑯ Mechanical interlock

<sup>1)</sup> 3RT201. contactors with one NC contact in the basic unit are required for the electrical interlock. An additional NO contact is required for momentary-contact operation.

Accessories see pages 2/66 to 2/81.

Motor Starters see Chapter 4 Combination Starters & Starters for group installation

3RT1 contactors – Sizes S6 to S12 with mountable accessories

(illustration for basic unit)

① 3RT10 and 3RT14 air-break contactor, sizes S6, S10 and S12

② Auxiliary switch block, solid-state time-delay (ON or OFF-delay or star-delta (wye-delta) starting)

③ 4-pole auxiliary switch block

④ 1-pole auxiliary switch block (up to 4 can be snapped on)

⑤ 2-pole auxiliary switch block, laterally mountable left or right

⑥ Surge suppressor (RC element) for plugging into top of withdrawable coil

⑦ Terminal cover for cable lug and busbar connection

⑧ Terminal cover for box terminal

⑨ Box terminal block

○ Accessories identical for sizes S6 to S12

○ Different accessories for sizes S6 and S10/S12

For accessories [see pages 2/66 to 2/83](#).

For mountable overload relays [see Chapter 3, "Overload Relays"](#).

4 Mechanical interlock (must be ordered separately)	3RA1954-2A	
5 Base plate for reversing contactor assemblies	3RA1962-2A	

For accessories see pages 2/66-2/83.

For mountable overload relays see Chapter 3, "Overload Relays".

3RT1 contactors – Sizes S6 to S12 with accessories

- ① 3RT10 and 3RT14 air-break contactor, sizes S6, S10 and S12 (3RT1054, size S6 shown here)
  - ② 3RT12 vacuum contactor, sizes S10 and S12 (3RT1266, size S10 shown here)
  - ③ Withdrawable coils for 3RT1...-A... contactors with conventional operating mechanism (size S10: differentiation between 3RT10/3RT14 air-break contactors and 3RT12 vacuum contactors) (size S12: the same for air-break and vacuum contactors)
  - ④ Withdrawable coils for 3RT1...-N... contactors with solid-state operating mechanism. (size S10: differentiation between 3RT10/3RT14 air-break contactors and 3RT12 vacuum contactors) (size S12: the same for air-break and vacuum contactors)
  - ⑤ Withdrawable coils and laterally mountable module (plug-on) for 3RT1...-P... air-break contactors with solid-state operating mechanism and remaining lifetime indicator
  - ⑥ Surge suppressor (RC element), plug-mountable on withdrawable coils
    - 3RT1...-A... with conventional operating mechanism
    - 3RT1...-N... with solid-state operating mechanism
- Same accessories for sizes S6 to S12  
 ● Different accessories depending on size

For surge suppressors [see page 2/73](#),  
 withdrawable coils [see page 2/98](#).

For mountable overload relays [see Chapter 3](#),  
 “Overload Relays”.

For technical data, see pages 2/182-2/183.  
 For int. circuit diagrams, see page 2/198.  
 For position of terminals, see page 2/206.

When the solid-state time-delay auxiliary switches are used, no other auxiliary switches are allowed to be mounted on the basic units.

1) AC voltage values apply for 50 Hz and 60 Hz.

2) Cannot be fitted onto coupling relays.

3) Setting of output contacts in as-supplied state not defined (bistable relay). Application of the control supply voltage once results in contact change-over to the correct setting.

4) Terminals A1 and A2 for the rated control supply voltage of the solid-state time-delay auxiliary switch must be connected to the associated contactor by means of connecting leads.

5) Position of the output contacts not defined in the as-delivered state (bistable relay). Applying the control voltage once results in the contacts switching to the correct position.

# Accessories for 3RT contactors / 3RH control relays

## Terminals, covers, adapters, connectors

CONTACTORS AND ASSEMBLIES 2

For contactors Type	Version	Order No.	Weight
------------------------	---------	-----------	--------

### Screw adapters for fixing the contactors

#### Sizes S0 and S2

NSB0\_01470  
3RT1926-4P

3RT2.2,  
3RT2.3

Screw adapters for easier screw fixing  
2 units required per contactor  
(1 pack contains 10 sets for 10 contactors)

3RT1926-4P

### Solder pin adapters for contactors up to 7.5 HP / 12 A

#### Size S00, up to 7.5 HP

3RT2.1,  
3RH21

Assembly kit for soldering contactors onto a printed circuit board.  
For 1 contactor, 1 set is required.

#### Screw terminals

3RT1916-4KA1

3RT1916-4KA1

### Solder pin adapters for contactors up to 7.5 HP / 12 A with mounted 4-pole auxiliary switch block

#### Size S00, up to 7.5 HP

3RT2.1,  
3RH21

Assembly kit for soldering contactors with an auxiliary switch block onto a printed circuit board.  
For 1 contactor, 1 set is required.

3RT1916-4KA2

3RT1916-4KA2

### Safety main current connectors for 2 contactors

#### Sizes S00 to S2

For series connection of 2 contactors

3RT2.1  
3RT2.2  
3RT2.3

3RA2926-1A

3RA2916-1A  
3RA2926-1A  
3RA2936-1A

1) Exception: contactors and contactor relays with auxiliary switch block mounted onto the front.

1) Size S00, S0 and S2 installation kits for paralleling are available in spring-type terminals. Change the last digit of the order number to a "2".

2) When using the function modules for wye-delta starting, the wiring modules for the auxiliary current are not required. See page 2/45 for more information.

3) Also requires quantity (1) 3RA2816-0EW20 function module set for all control functions. See page 2/45.

4) The 3RT19 56-4EA1 (S6) or 3RT19 66-4EA1 (S10, S12) cover can be used for shock-hazard protection.

# Contactor Assemblies for Switching Motors

## Current Monitoring Relays

### Overview

SIRIUS 3RR2242, 3RR2142 and 3RR2243 current monitoring relays

The SIRIUS 3RR2 current monitoring relays are suitable for the load monitoring of motors or other loads. In two or three phases they monitor the rms value of AC currents for overshooting or undershooting of set threshold values.

Whereas apparent current monitoring is used above all in connection with the rated torque or in case of overload, the active current monitoring option can be used to observe and evaluate the load factor over a motor's entire torque range.

The 3RR2 current monitoring relays can be integrated directly in the feeder by mounting onto the 3RT2 contactor; separate wiring of the main circuit is therefore superfluous. No separate transformers are required.

For a line-oriented configuration or simultaneous use of an overload relay, terminal supports for stand-alone installation are available for separate standard rail mounting.

### Versions

#### Basic versions

The basic versions with two-phase apparent current monitoring, a CO contact output and analog adjustability provide a high level of monitoring reliability especially in the rated and overload range.

#### Standard versions

The standard versions monitor the current in three phases with selectable active current monitoring. They have additional diagnostics options such as residual current monitoring and phase sequence monitoring, and they are also suitable for monitoring motors below the rated torque. These devices have an additional independent semiconductor output, an actual value indicator, and are digitally adjustable.

Both versions are available optionally with screw or spring-type terminals, in each case for sizes S00 and S0. With variants of size S2 the main current paths always have screw terminals; the control current side can have screw or spring-type terminals.

#### Note:

In addition to the features of the standard versions, 3RR24 monitoring relays for mounting onto 3RT2 contactors for IO-Link also offer the possibility of transmitting the measured values and diagnostics data to a controller via an IO-Link. Furthermore, the devices can be parameterized on the devices themselves or via IO-Link.

### Benefits

- Can be mounted directly on 3RT2 contactors and 3RA23 reversing contactor assemblies, in other words, there is no need for additional wiring in the main circuit
- Optimally coordinated with the technical characteristics of the 3RT2 contactors
- No separate current transformer required
- Versions with wide voltage supply range
- Variably adjustable to overshoot, undershoot or range monitoring
- Freely configurable delay times and RESET response
- Display of ACTUAL value and status messages
- All versions with removable control current terminals
- All versions with screw terminals or spring-type terminals
- Simple determination of the threshold values through direct reference to actually measured values for setpoint loading
- Range monitoring and selectable active current measurement mean that only one device for monitoring a motor is required along the entire torque curve
- In addition to current monitoring it is also possible to monitor for broken cables, phase failure, phase sequence, residual current and motor blocking

### Application

- Monitoring of current overshoot and undershoot
- Monitoring of broken conductors
- Monitoring of no-load operation and load shedding, e.g. in the event of a torn V-belt or no-load operation of a pump
- Monitoring of overload, e.g. on conveyor belts or cranes due to an excessive load
- Monitoring the functionality of electrical loads such as heaters
- Monitoring of wrong phase sequence on mobile equipment such as compressors or cranes
- Monitoring of high-impedance faults to ground, e.g. caused by damaged insulation or moisture

## Current Monitoring Relays with IO-Link

### Overview

SIRIUS 3RR2441, 3RR2442 and 3RR2443 current monitoring relays

The SIRIUS 3RR24 current monitoring relays for IO-Link are suitable for the load monitoring of motors or other loads. In three phases they monitor the rms value of AC currents for overshooting or undershooting of set threshold values.

Whereas apparent current monitoring is used above all in connection with the rated torque or in case of overload, the active current monitoring option, which is also selectable, can be used to observe and evaluate the load factor over a motor's entire torque range.

The 3RR24 current monitoring relays for IO-Link can be integrated directly in the feeder by mounting onto the 3RT2 contactor; separate wiring of the main circuit is therefore superfluous. No separate transformers are required.

For a line-oriented configuration or simultaneous use of an overload relay, terminal supports for stand-alone installation are available for separate standard rail mounting.

The SIRIUS 3RR24 current monitoring relays for IO-Link also offer many other options based upon the monitoring functions of the conventional SIRIUS 3RR2 monitoring relays:

- Measured value transmission to a controller, including resolution and unit, may be parameterizable as to which value is cyclically transmitted
- Transmission of alarm flags to a controller
- Full diagnosis capability by inquiry as to the cause of the fault in the diagnosis data record
- Remote parameterization is also possible, in addition to or instead of local parameterization

- Rapid parameterization of the same devices by duplication of the parameterization in the controller
- Parameter transmission by upload to a controller by IO-Link call or by parameter server (if IO-Link master from IO-Link Specification V 1.1 and higher is used)
- Consistent central data storage in the event of parameter change locally or via a controller
- Automatic reparameterizing when devices are exchanged
- Blocking of local parameterization via IO-Link possible
- Faults are saved in parameterizable and non-volatile fashion to prevent an automatic start up after voltage failure and to make sure diagnostics data is not lost
- By integration into the automation level the option exists of parameterizing the monitoring relay at any time via a display unit or displaying the measured values in a control room or locally at the machine/control cabinet

Even without communication via IO-Link the devices continue to function fully autonomously:

- Parameterization can take place locally at the device, independently of a controller
- In the event of failure or before the controller becomes available the monitoring relays work as long as the control supply voltage (24 V DC) is present
- If the monitoring relays are operated without the controller, the 3RR24 monitoring relays for IO-Link have, thanks to the integrated SIO mode, an additional semiconductor output, which switches when the adjustable warning threshold is exceeded

Thanks to the combination of autonomous monitoring relay function and integrated IO-Link communication, redundant sensors and/or analog signal converters – which previously took over the transmission of measured values to a controller, leading to considerable extra cost and wiring outlay – are no longer needed.

Because the output relays are still present, the monitoring relays increase the functional reliability of the system, since only the controller can fulfill the control tasks if the current measured values are available, whereas the output relays can also be used for the disconnection of the system if limit values that cannot be reached during operation are exceeded.

For further information on the IO-Link communication system, see [Chapter 14](#).

# Contactors and Contactor Assemblies for Switching Motors

## Current Monitoring Relays with IO-Link

### Benefits

- Can be mounted directly on 3RT2 contactors and 3RA23 reversing contactor assemblies, in other words, there is no need for additional wiring in the main circuit
- Optimally coordinated with the technical characteristics of the 3RT2 contactors
- No separate current transformer required
- Variably adjustable to overshoot, undershoot or range monitoring
- Freely configurable delay times and RESET response
- Display of ACTUAL value and status messages
- All versions with removable control current terminals
- All versions with screw or spring-type terminals
- Simple determination of the threshold values through direct reference to actually measured values for setpoint loading
- Range monitoring and selectable active current measurement mean that only one device for monitoring a motor is required along the entire torque curve
- In addition to current monitoring it is also possible to monitor for current unbalance, broken cables, phase failure, phase sequence, residual current and motor blocking
- Integrated counter for operating cycles and operating hours to support requirements-based maintenance of the monitored machine or application
- Simple cyclical transmission of the current measured values, relay switching states and events to a controller
- Remote parameterization
- Automatic reparameterizing when devices are exchanged
- Simple duplication of identical or similar parameterizations
- Reduction of control current wiring
- Elimination of testing costs and wiring errors
- Reduction of configuration work
- Integration in TIA means clear diagnostics if a fault occurs
- Cost saving and space saving in control cabinet due to the elimination of AI and IO modules as well as analog signal converters and duplicated sensors

### Application

- Monitoring of current overshoot and undershoot
- Monitoring of broken conductors
- Monitoring of no-load operation and load shedding, e.g. in the event of a torn V-belt or no-load operation of a pump
- Monitoring of overload, e.g. on pumps due to a dirty filter system
- Monitoring the functionality of electrical loads such as heaters
- Monitoring of wrong phase sequence on mobile equipment such as compressors or cranes
- Monitoring of high-impedance faults to ground, e.g. caused by damaged insulation or moisture

The use of SIRIUS monitoring relays for IO-Link is particularly recommended for machines and plant in which these relays, in addition to their monitoring function, are to be connected to the automation level for the rapid, simple and fault-free provision of the current measured values and/or for remote parameterization.

The monitoring relays can either relieve the controller of monitoring tasks or, as a second monitoring entity in parallel to and independent of the controller, increase the reliability in the process or in the system. In addition, the elimination of AI and IO modules allows the width of the controller to be reduced despite significantly expanded functionality.

## NEMA 1 Enclosure

### Selection and ordering data

- \* NEMA Type 1 Enclosures
- \* Lift off cover
- \* Accepts SIRIUS power control components
- \* Non-reversing contactors
- \* Reversing contactors
- \* Starters with thermal overload relays
- \* Starters with solid-state overload relays

### Application

The 49EC14\*B separate enclosures are designed for field assembly of a wide range of Siemens SIRIUS open style control components and field modification kits as listed in the charts below. Note that certain components require the addition of a DIN Rail kit for proper mounting in the enclosure.

### NEMA 1 Enclosures

Due to the mature nature of some product series, supply cannot be guaranteed on all versions listed on this page.

1) Maximum 4 blocks per relay.

# Contactors for Switching Motors

## 3RT contactors, 3-pole, sizes S00 to S3

### AC and DC operation

IEC 60 947, EN 60 947 (VDE 0660), UL 508

### Design

The 3RT contactors are suitable for use in any climate. They are safe from touch to DIN VDE 0106 Part 100.

The 3RT contactors are available screw, spring-type, or ring lug connections.

An auxiliary contact is integrated in the basic unit of size S00 contactors. The basic units of sizes S0 to S3 only contain the main conducting paths.

All the basic units can be extended with auxiliary switch blocks. Cabinet units with 2 NO + 2 NC (terminal designations acc. to EN 50 012) are available as of size S0; the auxiliary switch block is removable.

The size S3 contactors have removable box terminals for the main conductor connections. Ring cable lugs or bars can thus also be connected.

### Contact reliability

If voltages  $\leq 110$  V and currents  $\leq 100$  mA are to be switched, the auxiliary contacts of 3RT contactors and 3RH contactor relays should be used to ensure good contact stability.

These auxiliary contacts are suitable for electronic circuits with currents  $\geq 1$  mA at a voltage of 17 V.

### Short-circuit protection of contactors

For the short-circuit protection of contactors without an overload relay, see the technical data.

For the short-circuit protection of contactors with an overload relay, see section 3.

### Motor protection

3RU overload relays can be mounted onto the 3RT contactors for protection against overloads. The overload relays must be ordered separately (see section 3).

### Surge suppression

The 3RT contactors can be retrofitted with RC elements, varistors, diodes or diode assemblies (combination of an interference suppression diode and a Zener diode for short tripping times) for suppressing opening surges in the coil.

The surge suppressors are plugged onto the front of size S00 contactors. Space is provided for them next to a snap-on auxiliary switch block.

With all size S0 to S3 contactors, varistors and RC elements can be plugged on directly at the coil terminals, either on the top or underneath. Diode assemblies are available in two different designs with different polarities. Depending on the application, they can be attached either only on the bottom (assembly with circuit-breaker) or only on the top (assembly with overload relay).

The plug-in direction of the diodes and diode assemblies is determined by a coding device. Exceptions: 3RT29 26-1E.00 and 3RT19 36-1T.00; in these cases the plug-in direction is identified by "+" and "-".

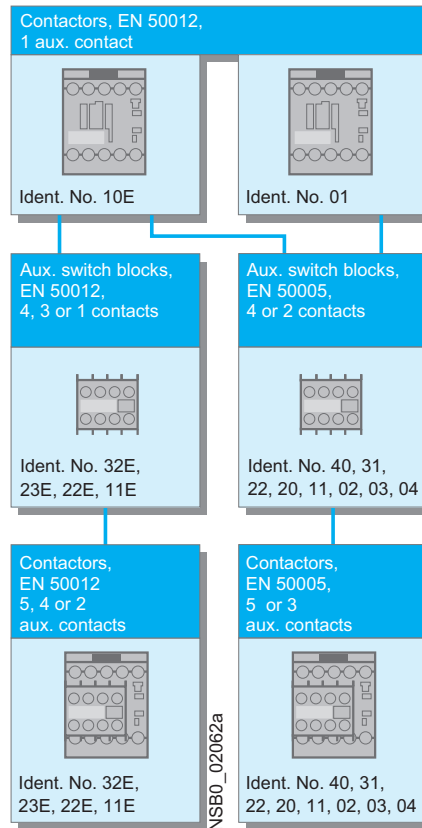

Coupling relays are supplied either without surge suppression or with a varistor or diode connected as standard, according to the design.

#### Note

*The opening times of the NO contacts and the closing times of the NC contacts increase if the contactor coils are protected against voltage peaks (interference suppression diode 6 to 10 times; diode assemblies 2 to 6 times; varistor +2 ms to 5 ms).*

### 3RT20 1. contactors (size S00),

Terminal designations acc. to EN 50 012 or DIN 50 005.

### Auxiliary switch blocks

The 3RT basic units can be extended with various auxiliary switch blocks, depending on the application:

#### Size S00 (3RT201)

Contactors with one NO contact as the auxiliary contact and with either screw or spring-type connections, identification number 10E, can be extended to obtain contactors with 2, 4 or 5 auxiliary contacts in accordance with EN 50 012 using auxiliary switch blocks. The identification numbers 11E, 22E, 23E and 32E on the auxiliary switch blocks apply to the complete contactors. These auxiliary switch blocks cannot be combined with contactors that have an NC contact in their basic unit, identification number 01, as these are coded.

All size S00 contactors with one auxiliary contact, identification number 10E or 01, and the contactors with 4 main contacts can be extended to obtain contactors with 3 or 5 auxiliary contacts (contactors with 4 main contacts: 2 or 4 auxiliary contacts) according to EN 50 005 using auxiliary switch blocks

with identification numbers 40 to 02. The identification numbers on the auxiliary switch blocks apply only to the attached auxiliary contacts.

Single or 2-pole auxiliary switch blocks that can be connected on either the top or the bottom facilitate quick, straightforward wiring, especially when assembling feeders. These auxiliary switch blocks are only available with screw-type terminals.

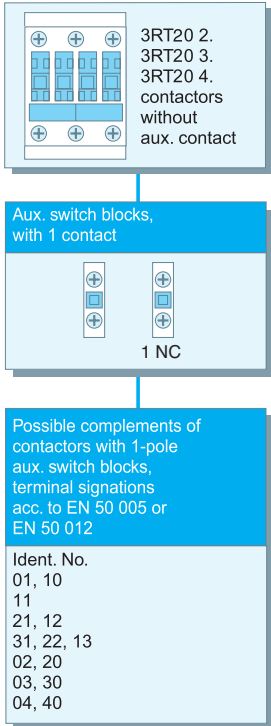

The solid-state compatible 3RH29 11-1NF.. auxiliary switch blocks for size S00 contactors contain two enclosed contact elements. They are ideal for switching low voltages and currents (hard gold-plated contacts) or for use in dusty atmosphere. The contacts do not have positively-driven operation.

All the above-mentioned auxiliary switch variants can be snapped into the location holes on the front of the contactors. The auxiliary switch block has a centrally positioned release lever for disassembly.

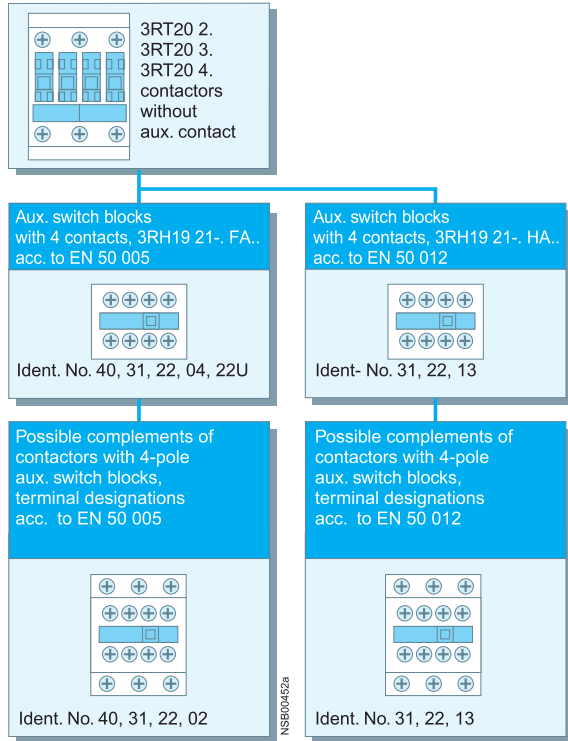

# Contactors for Switching Motors

## 3RT2 contactors, 3-pole, sizes S00 to S3

**3RT20 2. to 3RT20 4. contactors (sizes S0 to S3), single-pole auxiliary switch blocks,**  
terminal designations acc. to EN 50 005 or EN 50 012.

**3RT20 2. to 3RT20 4. contactors (sizes S0 to S3), single-pole auxiliary switch blocks,**  
terminal designations acc. to EN 50 005 or EN 50 012.

### Sizes S0 to S3 (3RT202 to 3RT204)

An extensive range of auxiliary switch blocks is available for various applications. The contactors themselves do not have an integrated auxiliary conducting path.

### The auxiliary switch variants are identical for all size S0 to S3 contactors.

One 4-pole or up to four single-pole auxiliary switch blocks (with screw or spring-type connections) can be snapped onto the front of the contactors. When the contactors are energized, the NC contacts open before the NO contacts close.

The terminal designations of the single-pole auxiliary switch blocks consist of location digits on the basic unit and function digits on the auxiliary switch blocks.

In addition, 2-pole auxiliary switch blocks (screw-type terminals) are provided for cable entries from above or below in the style of a four-connector block (feeder auxiliary switch).

If the available installation depth is restricted, 2-pole auxiliary switch blocks (screw or spring-type connections) can be mounted laterally on the left or right.

The auxiliary switch blocks designed for mounting onto the front can be disassembled with the aid of a centrally positioned release lever; the laterally mountable auxiliary switch blocks can be removed easily by pressing on the fluted grips.

The terminal designations of the individual auxiliary switch blocks comply with EN 50 005 or EN 50 012, while those of the complete contactors with an auxiliary switch block with 2 NO + 2 NC comply with EN 50 012.

The laterally mountable auxiliary switch blocks to EN 50 012 can only be used if no 4-pole auxiliary switch blocks are snapped onto the front. If single-pole auxiliary switch blocks are used in addition, the location digits on the contactor must be noted.

Two enclosed contact elements and two standard contact elements are available for the 3RH29 21-FE22 solid-state compatible auxiliary switch block mountable on the front. The laterally mountable 3RH29 21-2DE11 solid-state compatible auxiliary switch block contains 2 enclosed contact elements (1 NO + 1 NC). The enclosed contact elements are ideal for switching low voltages and currents (hard gold-plated contacts) or for use in a dusty atmosphere. The contacts are positively driven.

### Sizes S0 and S2 (3RT202 and 3RT203)

Up to four auxiliary contacts can be mounted, whereby any design of the auxiliary switch blocks is permitted. If two 2-pole, laterally mounted, auxiliary switch blocks are used, one must be mounted on the left and one on the right for the sake of symmetry.

Under certain circumstances, more auxiliary contacts are allowed for size S2 (please ask for details).

With regard to 3RT23 and 3RT24 4-pole contactors, please refer to pages 2/12 to 2/14.

### Sizes S3 to S12 (3RT204 to 3RT107)

Up to eight auxiliary contacts can be mounted, whereby the following points must be noted:

- Of these eight auxiliary contacts, no more than four must be NC contacts.
- If laterally mounted auxiliary switch blocks are used, they must be symmetrical.

With regard to 3RT15 4-pole contactors, please refer to pages 2/11 to 2/13.

# Contactors for Switching Motors

## 3RT1 contactors, 3-pole, sizes S6 to S12

CONTACTORS AND ASSEMBLIES 2

### Overview

#### Design

- 3RT10 contactors for switching motors
- 3RT12 vacuum contactors for switching motors
- 3RT14 contactors for AC-1 applications

#### Operating mechanism

Two types of solenoid-operated mechanism are available:

- Conventional operating mechanism
- Solid-state operating mechanism (with 3 performance levels)

#### UC operation

The contactors can be AC (40 to 60 Hz) and DC driven.

#### Withdrawable coils

To allow easy coil changing, for example if the application is changed, the magnetic coil can be pulled out upwards without tools after the release mechanism has been actuated, and can be replaced by any other required coil of the same size.

#### Auxiliary contact complement

The contactors can be equipped with a maximum of 8 auxiliary contacts, with identical auxiliary switch blocks from S0 to S12. Of these, no more than 4 are permitted to be NC contacts.

- 3RT10 and 3RT14 contactors: auxiliary contacts mounted laterally and on front
- 3RT12 vacuum contactors: auxiliary contact mounted laterally

### Contactors with conventional operating mechanism

#### 3RT1...-A:

The magnetic coil is switched on and off directly with the control supply voltage  $U_s$  via terminals A1/A2.

Multi-voltage range for the control supply voltage  $U_s$ : Several closely adjacent control supply voltages, available around the world, are covered by just one coil, for example UC 110-115-120-127 V or UC 220-230-240 V.

In addition, allowance is also made for a coil voltage tolerance of 0.8 times the lower rated control supply voltage ( $U_{s\ min}$ ) and 1.1 times the upper rated control supply voltage ( $U_{s\ max}$ ), within which the

contactor switches reliably and no thermal overloading occurs.

### Contactors with solid-state operating mechanism

The power required for reliable switching and holding is supplied selectively to the magnetic coil by series-connected control electronics.

#### Features:

- Extended voltage range for the control supply voltage  $U_s$ : Compared with the conventional operating mechanism, the solid-state operating mechanism covers an even broader range of globally available control supply voltages within one coil variant. For example, the globally available voltages 200-208-220-230-240-254-277 V are covered with the coil for UC 200 to 277 V ( $U_{s\ min}$  to  $U_{s\ max}$ ).

- Extended coil voltage tolerance 0.7 to  $1.25 \times U_s$ : On account of the broad range for the rated control supply voltage and the additionally allowed coil voltage tolerance of  $0.8 \times U_{s\ min}$  to  $1.1 \times U_{s\ max}$ , an extended coil voltage tolerance of at least 0.7 to  $1.25 \times U_s$ , within which the contactors will operate reliably, is available for the most common control supply voltages of 24, 110 and 230 V.
- Bridging short-time voltage dips: Control voltage failures dipping to 0 V (at A1/A2) are bridged for up to approx. 25 ms, therefore preventing unintentional disconnection.

- Defined ON and OFF thresholds: As of voltages  $\geq 0.8 \times U_{s\ min}$ , the electronics reliably switch the contactor on and as of  $\leq 0.5 \times U_{s\ min}$  it is reliably switched off. The differential travel in the switching thresholds prevents chattering of the main contacts and hence increased wear or welding when operated in weak, unstable networks. Similarly, thermal overloading of the contactor coil is prevented if the voltage applied is too low – the contactor is not switched on and is operated with overexcitation.
- Low control power consumption when closing and in closed state.

#### Electromagnetic compatibility (EMC)

The contactors with solid-state operating mechanism conform to the requirements for operation in industrial plants.

- **Noise immunity**
  - Burst (IEC 61 000-4-4): 4 kV
  - Surge (IEC 61 000-4-5): 4 kV
  - Electrostatic discharge, ESD (IEC 61 000-4-2): 8/15 kV
  - Electromagnetic field (IEC 61 000-4-3): 10 V/m
- **Emitted interference**
  - Limiting value class A to EN 55 011

**Note:**  
In connection with converters, the control cables should be installed separately from the load cables to the converter.

### 3RT1...-N: for DC 24 V PLC output

#### 2 control options:

- Control without an interface directly via a DC 24 V  $\geq 30$  mA PLC output (EN 61 131-2). Connection via a 2-pole plug-in connection; the connector, using screwless spring-force technology, is included in the scope of supply. The control supply voltage for supplying power to the solenoid operating mechanism must be connected to A1/A2.

- ① Sliding-dolly switch, must be in PLC "ON" position
- ② Plug-in connection, 2-pole

- Conventional control by applying the control supply voltage at A1/A2 via a switching contact.

**Note:**  
The sliding-dolly switch must be in the "PLC OFF" position (= setting ex works).

- ① Sliding-dolly switch, must be in PLC "OFF" position

# Contactors for Switching Motors

## 3RT1 contactors, 3-pole, sizes S6 to S12

### Overview

#### Contactors with solid-state operating mechanism

**3RT1...-P:** for DC 24 V PLC output or PLC relay output, with indication of remaining lifetime  
(Indication of remaining lifetime RLT: see 2/69.)

To supply power to the solenoid operating mechanism and the remaining lifetime indication, the control supply voltage  $U_s$  must be run to terminals A1/A2 of the laterally mounted electronics module. The control inputs of the contactor are brought out to a 7-pole plug-in connection; the connector, using screwless spring-force technology, is included in the scope of supply.

- The remaining lifetime RLT status signal is available at terminals R1/R2 via a floating relay contact (hard gold-plated, enclosed) and can be processed for example via SIMOCODE-DP or PLC inputs or elsewhere.

Permissible current carrying capacity of relay output R1/R2:  
 –  $I_{e,AC}$ -15/24 to 230 V: 3 A  
 –  $I_{e,DC}$ -13/24 V: 1 A

#### LED indicators

- The following statuses are indicated by LEDs on the laterally mounted electronics module:
- Contactor ON (energized state): Green LED ("ON")
  - Indication of remaining lifetime (see 2/69)

#### 2 control options:

- Contactor control without an interface directly via a DC 24 V  $\geq 30$  mA PLC output (EN 61 131-2) via terminals IN+/IN-.

Electronics module of 3RT1 ...-P contactor  
 Plug-in connection, 7-pole

S1 Changeover switch from automatic control via PLC semiconductor output to local control

S2 Local control option

Possibility of switching from automatic control to local control via terminals H1/H2, i.e. automatic control via a PLC or SIMOCODE-DP/PROFIBUS-DP can be deactivated, for example during start-up or in the event of a fault, and the contactor can be controlled manually.

- Contactor control via relay outputs, e.g. by
  - PLC
  - SIMOCODE-DP 3UF5 via terminals H1/H2.
 Contact loading:  
 $U_s$ /approx. 5 mA.

When operated via SIMOCODE-DP, a communication link to PROFIBUS-DP is also provided.

Electronics module of 3RT1 ...-P contactor  
 Plug-in connection, 7-pole

S1 Changeover switch from automatic control, e.g. via SIMOCODE-DP or PLC relay output to local control

S2 Local control option

#### 3RT12 vacuum contactors

In contrast with the 3RT10 contactors – the main contacts operate in air under atmospheric conditions – the contact gaps of the 3RT12 vacuum contactors are contained in hermetically enclosed vacuum contact tubes. Neither arcs nor arcing gases are produced. The particular benefit of 3RT12 vacuum contactors, however, is that their electrical endurance is at least twice as long as that of 3RT10 contactors.

They are therefore particularly well suited to frequent switching in jogging/mixed operation, for example in crane control systems.

#### Advantages:

- Very long electrical endurance
- High short-time current-carrying capacity for heavy starting
- No open arcs, no arcing gases, i.e. no minimum clearances from earthed parts required either
- Longer maintenance intervals
- Increased plant availability

#### Notes on operation:

– Switching motors with rated operational voltages  $U_e > 500$  V:

In order to damp overvoltages and protect the motor winding insulation against multiple reignition when switching off three-phase motors, it is recommended to fit the contactors on the outgoing side (T1/T2/T3) with the 3RT19 66-1PV. surge suppression module – RC varistor – (accessory).

This additional equipment is not required for operation in circuits with converters. It might be damaged by the voltage peaks and harmonics generated.

- Switching DC voltage: Vacuum contactors are basically unsuitable for switching DC voltage.

# Contactors Assemblies for Switching Motors

## Contactors assemblies for WYE-delta starting

### Overview

The contactor assemblies for star-delta starting can be ordered as follows:

- Sizes S00-S0 as assemblies. (see pages 2/47-2/48)
- Sizes S2-S12 as components for customer assembly

HP	Calculated horsepower ratings at 460 V AC	Operat. current $I_e$ A	Motor current A	Size	Line/delta contactor	WYE contactor	Accessories for customer assembly

3RA1953-3D <sup>5)</sup>	3RT1946-4BA31	3RA1952-2E	-	-	50 ... 200	3RB2056-1FC2		

3) Installation kit contains wiring connector on the bottom (connection between delta contactor and WYE contactor) and WYE jumper.  
 4) Wiring connector on top from reversing contactor assembly (note conductor cross-sections).

5) A mechanical interlock adapter, 3RA1954-2C, is required to use the standard 3RA1954-2A mechanical interlock for the AC version of the S6-S6-S3 WYE-Delta starter. The S6-S6-S3 WYE-Delta DC version would require a special custom build spacer, which is not manufactured, to allow the mechanical interlock to operate.

6) Only use wiring connector on the top from reversing contactor assembly (note conductor cross-sections); order WYE jumper in addition.  
 7) For overload relays >100A, see 3RB2 electronic Section 3, page 23.

# Contactors Assemblies for Switching Motors

## Contactors assemblies for WYE-delta starting

### Application

WYE-delta starting can only be used either if the motor normally operates in a  $\Delta$  (delta) connection or starts softly or if the load torque during  $\Upsilon$  starting is low and does not increase sharply. On the  $\Upsilon$  step the motors can carry approximately 50% (class KL 16) or 30% (class KL 10) of their rated torque; the starting torque is approximately  $\frac{1}{3}$  of that during direct on-line starting. The starting current is approximately 2 to 2.7 times the rated motor current.

The changeover from  $\Upsilon$  to  $\Delta$  must not be effected until the motor has run up to rated speed. Drives which require this changeover to be performed earlier are unsuitable for WYE-delta starting.

The ratings given in the above table are only applicable to motors with a starting current ratio of  $I_A \leq 8.4 \times I_N$  and using either a 3RT19 16-2G or 3RT19 26-2G solid-state time-delay auxiliary switch block with a WYE-delta function or a 3RP1574 WYE-delta time-delay relay with a dead interval of approximately 50 ms on reversing.

For the circuit diagrams for the main and control circuits, see page 2/161. The size selected for the installation kits for WYE-delta starting is determined by the line contactor.

### Design

#### Components for customer assembly

Installation kits with wiring connectors and, if necessary, mechanical connectors are available for contactor assemblies for WYE-delta starting. Contactors, overload relays, star-delta time-delay relays and auxiliary switches for the electrical interlock – if required also feeder terminals, mechanical interlocks <sup>1)</sup> and baseplates – must be ordered separately.

The wiring installation kits for sizes S00 and S0 contain the top and bottom main conducting path connections between the line and delta contactors (top) and between the delta and WYE contactors (bottom).

In the case of sizes S2 to S12 only the bottom main conducting path connection between the delta and WYE contactors is included in the wiring connector, owing to the larger conductor cross-section at the infeed.

### Motor protection

Overload relays or thermistor motor protection tripping units can be used for overload protection.

The overload relay can be either mounted onto the line contactor or separately fitted. It must be set to 0.58 times the rated motor current.

### Surge suppression

#### Sizes S00 to S3

All contactor assemblies can be fitted with RC elements, varistors or diode assemblies for damping opening surges in the coil.

As with the individual contactors, the surge suppressors can either be plugged onto the top of the contactors (S00) or fitted onto the coil terminals on the top or bottom (S0 to S3).

#### Sizes S6 to S12

The contactors are fitted with varistors as standard.

1) Exception:  
The mechanical interlock between the delta and WYE contactors is included in the installation kit for size S00 contactor assemblies.

# Control Relays, Coupling Relays

## 3RH21 control relays, size S00 with 4 or 8 contacts

### AC and DC operation

IEC 60947, EN 60947.

The 3RH2 contactor relays have screw, ring lug terminal or spring-type terminals. Four contacts are available in the basic unit.

The 3RH2 contactor relays are suitable for use in any climate. They are finger-safe according to EN 50274. The devices with ring lug terminal connection comply with degree of protection IP20 when fitted with the related terminal cover.

### Contact reliability

High contact stability at low voltages and currents, suitable for solid-state circuits with currents  $\geq 1$  mA at a voltage of 17 V.

### Surge suppression

RC elements, varistors, diodes or diode assemblies (combination of a diode and a Zener diode) can be plugged onto all contactor relays from the front for damping opening surges in the coil. The plug-in direction is determined by a coding device.

### Note:

*The OFF-delay of the NO contact and the ON-delay of the NC contact are increased if the contactor coils are attenuated against voltage peaks (noise suppression diode 6 to 10 times; diode assemblies 2 to 6 times, varistor +2 to 5 ms).*

### Auxiliary switch blocks

The 3RH2 contactor relays can be expanded by up to four contacts by the addition of snap-on auxiliary switch blocks.

The auxiliary switch block can easily be snapped onto the front of the contactors. The auxiliary switch block has a centrally positioned release lever for disassembly.

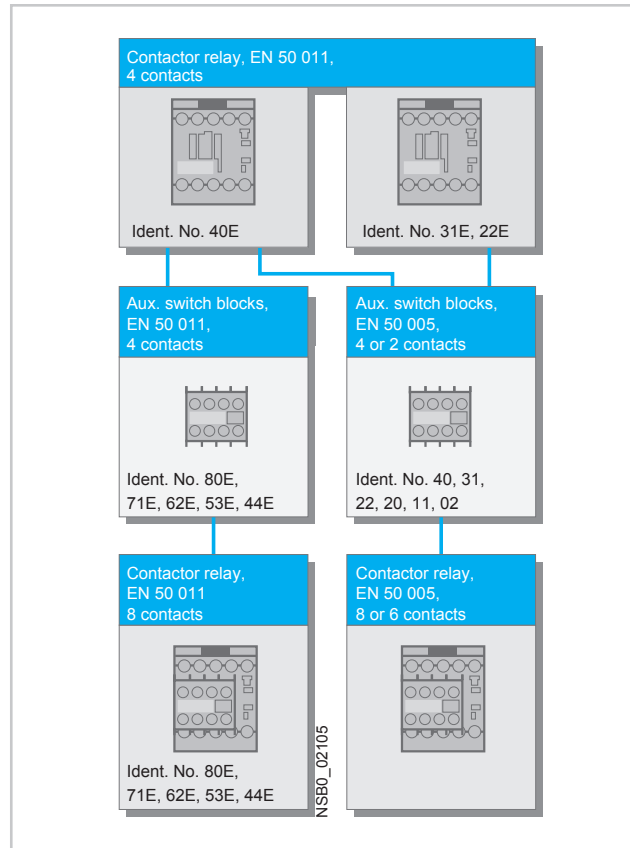

The contactor relays with 4 contacts according to EN 50011, with the identification number 40E, can be extended with 80E to 44E auxiliary switch blocks to obtain contactor relays with 8 contacts according to EN 50011. The identification numbers 80E to 44E on the auxiliary switch blocks apply to the complete contactors. These auxiliary switch blocks (3RH29 11-1GA..) cannot be combined with contactor relays with identification numbers 31E and 22E; they are coded.

All contactor relays with 4 contacts according to EN 50011, identification numbers 40E to 22E, can be extended with auxiliary switch blocks 40 to 02 to obtain contactor relays with 6 or 8 contacts in accordance with EN 50005. The identification numbers on the auxiliary switch blocks apply only to the attached auxiliary switch blocks.

In addition, fully mounted 3RH22 8-pole contactor relays are available; the mounted 4-pole auxiliary switch block in the 2nd tier is not removable. The terminal designations are according to EN 50011.

These versions are built according to special Swiss regulations SUVA and are distinguished externally by a red labeling plate.

Of the auxiliary contacts (integrated plus mountable) possible on the device, no more than four NC contacts are permitted.

## 3RH24 latched control relays, size S00

### Application

#### AC and DC operation

IEC 60 947, EN 60 947 (VDE 0660)

The terminal designations comply with EN 50 011.

The relay coil and the coil of the release solenoid are both designed for continuous duty.

The number of auxiliary contacts can be extended by means of auxiliary switch blocks (up to 4 poles).

RC elements, varistors, diodes or diode assemblies can be plugged onto both coils

from the front for damping opening surges.

The control relay can also be switched on and released manually.

# Contactors for Switching Motors

## 3TF68 and 3TF69 vacuum contactors, 3-pole

### Design

EN 60 947-4-1 (VDE 0660 Part 102).

The 3TF contactors are suitable for use in any climate. They are safe from touch according to DIN VDE 0106 Part 100. Terminal covers (see accessories) may have to be fitted onto the connecting bars, depending on the configuration with other devices.

### Main contacts

#### Contact erosion indication with 3TF68/69 vacuum contactors

The contact erosion of the vacuum interrupters can be monitored in the closed position by means of three white double slides on the contactor base.

The vacuum interrupter must be replaced if the distance indicated by one of the double slides is less than 0.5 mm while the contactor is in the closed position.

It is advisable to replace all three interrupters in order to ensure maximum reliability.

### Auxiliary contacts

The terminal designations comply with EN 50 012.

When the contactors are energized, the NC contacts open before the NO contacts close.

#### Contact reliability

The auxiliary contacts are extremely reliable and as such are suitable for electronic circuits

- with currents  $\geq 1$  mA,
- at voltages greater than 17 V.

### Surge suppression

#### Control circuit

Protection of the coil circuits against surges:

#### AC operation

- fitted with varistors as standard.

#### DC operation

- Retrofitting options:
- varistors.

### Electromagnetic compatibility (EMC)

3TF68/69...C contactors for AC operation are equipped with an electronically controlled solenoid mechanism with a high level of immunity to interference (see table opposite).

#### Note:

In operation in installations where it is not possible to observe the emitted interference limits, e.g. as an output contactor in static frequency changers, use of 3TF68/69...Q contactors (NS E catalogue, available in German) is recommended, without a main conductor path circuit (for further information refer also to the description below).

Contactors Type	Rated control supply voltage $U_s$	Overvoltage type (IEC 60 801)	Severity to IEC 60 801	Surge strength
3TF68 44-.C.., 3TF69 44-.C..	110 V ... 132 V	Burst	3	2 kV
	200 V ... 276 V	Surge	4	6 kV
	380 V ... 600 V	Burst	4	4 kV
		Surge	4	5 kV
		Burst	4	4 kV
		Surge	4	6 kV

### Circuit of the main conducting paths

An integrated RC varistor circuit in the main conducting paths of the contactors damps the rate of rise of switching overvoltages to uncritical values. Multiple restriking of the switching arcs is thereby prevented.

The operator of an installation can thus assume that the danger to the motor winding arising from switching overvoltages with a high rate of rise is ruled out.

The contactors can therefore be used without reservation for all AC switching applications, including three-phase motors with the demanding AC-4 utilization category.

#### Important note

The surge suppression circuit is not necessary when 3TF68/69 contactors are used in circuits with e.g. d.c. choppers, frequency converters or variable-speed drives.

It might be damaged by the voltage peaks and harmonics generated. This may also cause phase-to-phase short-circuits in the contactors.

**Remedy:** Order the special contactor design without surge suppression. In this case the Order No. must be supplemented with "-Z" and the order code "A02". No additional charge is made.

### Short-circuit protection of contactors

For assembling fuseless load feeders, please select a circuit-breaker/contactor combination according to the brochure entitled "Verbraucherabzweige in sicherungsloser Bauweise", Order No. E20001-P285-A726 (available in German only).

# Accessories for 3RT / 3RH Contactors

## Solid-state, time-delay auxiliary switch box

The timer module, which is available in "ON-delay" and "OFF-delay" designs, allows time-delayed functions up to 100 s (3 distinct delay ranges).

It contains a relay with one NO contact and one NC contact; the relay is switched either after an ON-delay or after an OFF-delay.

The timer module with a WYE-DELTA function is equipped with one delayed and one instantaneous NO contact, with an interval time of 50 ms between the two (see diagram). The delay time of the NO contact can be set between 1.5 s and 30 s.

### WYE-delta function

The timer module, which is available in "ON-delay" and "OFF-delay" with auxiliary power supply designs, allows time-delayed functions up to 100 s (3 distinct delay ranges). Contactors fitted with a time-delay block close or open after a delay according to the set time.

The ON-delay variant of the time-delay relay is connected in series with the contactor coil; terminal A1 of this coil must not be connected.

With the OFF-delay variant of the time-delay relay, the contactor coil is contacted directly via the relay; terminals A1 and A2 of the coil must not be connected.

The time-delay relays are suitable for both AC and DC operation.

The contactor on which the solid-state, time-delay auxiliary switch block is mounted operates without a delay.

### Size S00 (3RT201)

The solid-state, time-delay auxiliary switch block is fitted onto the front of the contactor. The timer module is supplied with power directly by plug-in contacts via the coil terminals of the contactor, in parallel with A1/A2. The time function is activated by closing the contactor on which the auxiliary switch block is mounted. The OFF-delay variant operates without an auxiliary power supply. Minimum ON period: 200 ms.

A varistor is integrated in the timer module for damping opening surges in the contactor coil.

The solid-state, time-delay auxiliary switch block cannot be mounted on size S00 coupling relays.

### Sizes S0 to S12 (3RT202 to 3RT107)

The solid-state, time-delay auxiliary switch block is fitted onto the front of the contactor.

The timer module is supplied with power via two terminals (A1/A2); the time delay of the auxiliary switch block can be activated either by a parallel link to any contactor coil or by any power source.

The OFF-delay variant operates without an auxiliary power supply. Minimum ON period: 200 ms.

A single-pole auxiliary switch block cannot be snapped onto the front of the contactor in addition to the timer module.

The timer module has no integrated components for damping opening surges.

## Solid-state time-delay block with semiconductor output

### Size S00 (3RT201)

The variant for size S00 contactors is fitted onto the front of the contactor (with the supply voltage switched off) and then slid into its latched position; at the same time, the time-delay relay is connected by means of plug-in contacts to coil terminals A1 and A2 of the contactor. Any contactor coil terminals which are not required are sealed off by means of covers on the enclosure of the time-delay block, to prevent them from being connected inadvertently (for circuit diagrams, see page 2/149).

A varistor is integrated in the timer module for damping opening surges in the contactor coil.

The solid-state, time-delay block cannot be mounted on size S00 coupling relays.

### Sizes S0 to S3 (3RT202 to 3RT107)

The time-delay block for size S0 to S3 contactors is plugged into coil terminals A1 and A2 on top of each contactor; the time-delay relay is connected both electrically and mechanically by means of pins.

A varistor is integrated in the timer module for damping opening surges in the contactor coil.

### Configuration note

Activation of loads parallel to the start input is not permitted with AC operation (see ②).

The 3RT19 16-2D.../3RT19 26-2D... time-delay blocks with an OFF delay have a voltage-carrying start input B1. This means that if there is a parallel load on terminal B1, activation can be simulated with AC voltage. In this case, the additional load (e.g. contactor K3) must be wired as shown in ①.

# Accessories for 3RT / 3RH Contactors

## 3-phase EMC interference suppression module for size S00 contactor

A so-called back-e.m.f. (electromotive force) is produced when motors or various inductive loads are turned off. Voltage peaks of up to 4 000 V may occur as a result, with a frequency spectrum from 1 kHz to 10 MHz and a rate of voltage variation from 0.1 to 20 V/ns.

The connection between the main conducting path and the EMC interference suppression module enables contact arcing, which is responsible for contact erosion and the majority of clicking noises, to be reduced; this in turn is conducive to an electromagnetically compatible design.

Since the EMC interference suppression module achieves a significant reduction in radio-frequency components and the voltage level in three phases, the contact endurance is also improved considerably. This makes an important contribution towards enhancing the reliability and availability of the system as a whole.

There is no need for fine graduations within each performance class, as smaller motors inherently have a higher inductance, so that one solution for all fixed-speed drives up to 7.5 HP is adequate.

Two electrical variants are available:

The advantages of the RC circuit lie mainly in the reduction in the rate of rise and in its RF damping ability. The selected values ensure effective interference suppression over a wide range.

The varistor circuit is able to absorb high energy levels and is also suitable for frequencies from 10 to 400 Hz (variable-speed drives). There is no limiting below the knee-point voltage, however.

### OFF-delay device for size S00 to S3 contactors

**AC and DC operation**  
IEC 60 947, EN 60 947

For screwing and snapping onto 35 mm standard mounting rail. The OFF-delay devices have screw connections.

contactor does not open. The 3RT19 16/3RT29 16 OFF-delay devices are specifically designed for operation with the 3RT contactors and 3RH contactor relays of the SIRIUS series.

A contactor opens after a delay when the capacitors of the contactor coil, built into the OFF-delay device, are switched in parallel. In the event of voltage failures, the capacitors are discharged via the coil and thereby delay the opening of the contactor.

**Operation**

In the case of the versions for rated control supply voltages of 110 V and 230 V, either AC voltage or DC voltage can be applied on the line side, where as the variant for 24 V is designed for DC operation only. A DC-operated contactor is connected to the output in accordance with the input voltage that is applied.

**Application**

The OFF-delay device prevents a contactor from dropping out unintentionally when there is a short-time voltage dip or voltage failure. It supplies the necessary power for a series-connected, DC-operated contactor during a voltage dip to ensure that the

**Principle of operation**

The OFF-delay device operates without external voltage on a capacitive basis, and can be energized with either AC or DC (24 V version for DC operation only). Voltage matching, which is only necessary with AC operation, is performed using a rectifier bridge.

If the command devices are upstream of the OFF-delay device in the circuit, the OFF delay takes effect with every opening operation. If the opening operation is downstream of the OFF-delay device, an OFF delay only applies in the event of failure of the mains voltage.

The mean value of the OFF delay is approximately 1.5 times the specified minimum time.

# Accessories for 3RT Contactors

Interface for mounting on size S0 to S3 contactors

### Application

#### DC operation

IEC 60 947 and EN 60 947  
The interface is suitable for use in any climate. It is safe from touch to DIN VDE 0106 Part 100. The terminal designations conform to EN 50 005.

### Functions

#### Design

System-compatible operation with DC 24 V, coil voltage tolerance 17 V to 30 V.  
Low power consumption in conformity with the technical data of the electronic systems.  
A light-emitting diode indicates the circuit state.

#### Surge suppression

The 3RH29 24-1GP11 interface has an integrated surge suppressor (varistor) for the contactor coil being switched.

#### Mounting

The 3RH29 24-1GP11 interface is mounted directly on the contactor coil.

<b>Contact reliability at 17 V, 1 mA</b> acc. to EN 60947-5-4			Frequency of contact faults $<10^{-8}$ i. e. $<1$ fault per 100 million operating cycles

**Endurance of the auxiliary contacts**

It is assumed that the operating mechanisms are switched randomly, i. e. not synchronized with the phase angle of the supply system. The contact endurance is mainly dependent on the breaking current.

The characteristic curves apply to:

- Integrated auxiliary contacts on 3RT20
- Auxiliary switch blocks 3RH 29 11, 3RH29 21 for contactors size S00 and S0.

<sup>1)</sup> Integrated auxiliary contacts in size S0, auxiliary switches for snapping onto the front and for mounting onto the side in size S00 and S0:  $I_e = 6$  A at AC-14/AC-15.

# Contactors for Switching Motors

## 3RT2 contactors

### Endurance of the main contacts

The characteristic curves show the contact endurance of the contactors when switching resistive and inductive AC loads (AC-1/AC-3) depending on the breaking current and rated operational voltage. It is assumed that the operating mechanisms are switched randomly, i. e. not synchronized with the phase angle of the supply system.

The rated operational current  $I_e$  complies with utilization category AC-4 (breaking six times the rated operational current) and is intended for a contact endurance of at least 200,000 operating cycles.

If a shorter endurance is sufficient, the rated operational current  $I_e/AC-4$  can be increased.  $I_e$

**If the contacts are used for mixed operation**, i. e. normal switching (breaking the rated operational current according to utilization category AC-3) in combination with intermittent inching (breaking several times the rated operational current according to utilization category AC-4), the contact endurance can be calculated approximately from the following equation:

$$X = \frac{A}{1 + \frac{C}{100} \left( \frac{A}{B} - 1 \right)}$$

Characters in the equation:

- X Contact endurance for mixed operation in operating cycles
- A Contact endurance for normal operation ( $I_a = I_e$ ) in operating cycles
- B Contact endurance for inching ( $I_a = \text{multiple of } I_e$ ) in operating cycles
- C Inching operations as a percentage of total switching operations

• Finely stranded with end sleeve	mm <sup>2</sup>	2 x (0.5 ... 2.5)		
• Finely stranded without end sleeve	mm <sup>2</sup>	2 x (0.5 ... 2.5)		
• AWG cables, solid or stranded	AWG	1 x (20 ... 12)		
<b>Auxiliary conductors for front and laterally mounted auxiliary switches</b> (1 or 2 conductors can be connected)				
• Operating devices	mm	3.0 x 0.5; 3.5 x 0.5		
• Solid	mm <sup>2</sup>	2 x (0.5 ... 2.5)		
• Finely stranded with end sleeve	mm <sup>2</sup>	2 x (0.5 ... 1.5)		
• Finely stranded without end sleeve	mm <sup>2</sup>	2 x (0.5 ... 1.5)		
• AWG cables, solid or stranded	AWG	2 x (20 ... 14)		
<b>Main conductors and auxiliary conductors</b>				<b>Ring lug terminal connection</b>
• Terminal screw		M3, Pozidriv 2		
• Operating devices	mm	Ø 5 ... 6		
• Tightening torque	Nm	0.8 ... 1.2		
• Usable ring terminal lugs	mm	d <sub>2</sub> = min. 3.2		
- DIN 46234 without insulation sleeve	mm	d <sub>3</sub> = max. 7.5		
- DIN 46225 without insulation sleeve				
- DIN 46237 with insulation sleeve				
- JIS C2805 Type R without insulation sleeve				
- JIS C2805 Type RAV with insulation sleeve				
- JIS C2805 Type RAP with insulation sleeve				

For tool for opening the spring-type terminals (see Accessories on page 2/79).  
Maximum external diameter of the conductor insulation: 3.6 mm.

An "insulation stop" must be used for conductor cross-sections ≤ 1 mm<sup>2</sup> (see Accessories on page 2/79).

<sup>1)</sup> If two different conductor cross-sections are connected to one clamping point, both cross-sections must lie in the range specified.

Dimensions (W x H x D) for DC operation <sup>1)</sup>		mm					
• With mounted auxiliary switch block		mm					
• With mounted function block		mm					
<b>General data</b>							
<b>Permissible mounting positions</b>							
The contactors are designed for operation on a vertical mounting surface.							
Upright mounting position							
AC and D operation							
Special version required, also applies to 3RT20 2.-.K.40. coupling relays.							
<b>Mechanical endurance</b>							
• Basic unit	Operating cycles	10 million					
• Basic unit with snap-on auxiliary switch block	Operating cycles	10 million					
• Solid-state compatible auxiliary switch block	Operat. cycles	5 million					
<b>Electrical endurance</b>							
2)							
<b>Rated insulation voltage <math>U_i</math></b> (pollution degree 3)	V	690					
<b>Rated impulse withstand voltage <math>U_{imp}</math></b>	kV	6					
<b>Protective separation</b> between the coil and the main contacts (acc. to EN 60947-1, Appendix N)	V	400					
<b>Mirror contacts</b>							
A mirror contact is an auxiliary NC contact that cannot be closed simultaneously with a NO main contact.							
• 3RT20 2., 3RT23 2. (removable auxiliary switch block)							
Yes, acc. to EN 60947-4-1, Appendix F							
• 3RT20 2., 3RT23 2. (permanently mounted auxiliary switch block)							
Yes, acc. to EN 60947-4-1, Appendix F							
<b>Permissible ambient temperature</b>							
• During operation	°C	-25 ... +60					
• During storage	°C	-55 ... +80					
<b>Degree of protection</b> acc. to EN 60947-1, Appendix C							
IP20, coil assembly IP20							
<b>Touch protection</b> acc. to EN 50274							
Finger-safe							
<b>Shock resistance</b> rectangular pulse							
• AC operation	g/ms	7.5/5 and 4.7/10			8.3/5 and 5.3/10		
• DC operation	g/ms	>10/5 and 7.5/10			>10/5 and 7.5/10		
<b>Shock resistance</b> sine pulse							
• AC operation	g/ms	11.8/5 and 7.4/10			13.5/5 and 8.3/10		
• DC operation	g/ms	>15/5 and >10/10			>15/5 and >10/10		
<b>Conductor cross-sections</b>							
3)							
<b>Short-circuit protection for contactors without overload relays</b>							
<b>Main circuit</b>							
For short-circuit protection for contactors with overload relays see "Protection Equipment -> Overload Relays".							
For short-circuit protection for fuseless load feeders see "Motor Starters".							
• Fuse links, operational class gG : Type NH 3NA, DIAZED 5SB, NEOZED 5SE acc. to IEC 60947-4-1/ EN 60947-4-1	A	63		100		125

• DC operation	- Closing delay	ms	55 ... 80	55 ... 80	60 ... 80	56 ... 70	60 ... 80	
	- Opening delay	ms	16 ... 17	16 ... 17	30 ... 45	35 ... 45	30 ... 50	

<sup>1)</sup> The OFF-delay of the NO contact and the ON-delay of the NC contact are increased if the contactor coils are attenuated against voltage peaks (varistor +2 ms to 5 ms, diode assembly: 2 to 6 times).

# Contactors for Switching Motors

## 3RT20 2. contactors

Contactors	Type		3RT20 23	3RT20 24	3RT20 25	3RT20 26	3RT20 27	3RT20 28
	Size		S0	S0	S0	S0	S0	S0
	Width	mm	45	45	45	45	45	45

### Main circuit

#### AC capacity

##### Utilization category AC-1, switching resistive loads

• Rated operational current $I_e$	At 40 °C up to 690 V	A	40				50	
	At 60 °C up to 690 V	A	35				42	
• Rated power for AC loads <sup>1)</sup> P.f. = 0.95 (at 60 °C)	230 V	kW	13.3				15.5	
	400 V	kW	23				27.5	
	500 V	kW	29				35	
	690 V	kW	40				47.5	
• Minimum conductor cross-section for loads with $I_e$	At 40 °C	mm <sup>2</sup>	10				10	
	At 60 °C	mm <sup>2</sup>	10				10	

##### Utilization category AC-3

• Rated operational currents $I_e$	Up to 400 V	A	9	12	17	25	32	38
	440 V	A	9	12	17	22	32	35
	500 V	A	9	12	17	18	32	32
	690 V	A	9	9	13	13	21	21
• Rated power for slipping or squirrel-cage motors at 50 and 60 Hz	At 230 V	HP	3	3	5	7.5	10	10
	460 V	HP	5	7.5	10	15	20	25
	575 V	HP	7.5	10	15	20	25	25

<b>Thermal load capacity</b>	10 s current <sup>2)</sup>	A	80	110	150	200	260	300
<b>Power loss per conducting path</b>	at $I_e$ /AC-3	W	0.4	0.5	0.9	1.6	2.7	3.8

##### Utilization category AC-4 (for $I_a = 6 \times I_e$ )

• Rated operational current $I_e$	Up to 400 V	A	8.5	12.5	15.5	15.5	22	
• Rated power for squirrel-cage motors with 50 and 60 Hz	At 400 V	kW	4	5.5	7.5	7.5	11	
• The following applies to a contact endurance of about 200000 operating cycles:								
- Rated operational currents $I_e$	Up to 400 V	A	4.1	5.5	7.7	9	12	
	690 V	A	3.3	5.5	7.7	9	12	
- Rated power for squirrel-cage motors with 50 and 60 Hz	At 110 V	kW	0.5	0.73	1	1.2	1.6	
	At 230 V	kW	1.1	1.5	2	2.5	3.4	
	400 V	kW	2	2.6	3.5	4.4	6	
	500 V	kW	2	3.3	4.6	5.6	7.5	
	690 V	kW	2.5	4.6	6	7.7	10.3	

### Switching frequency

#### Switching frequency $z$ in operating cycles/hour

• Contactors without overload relays	No-load switching frequency AC	h <sup>-1</sup>	5000					
	No-load switching frequency DC	h <sup>-1</sup>	1500					
Dependence of the switching frequency $z'$ on the operational current $I'$ and operational voltage $U'$ : $z' = z \cdot (I_e/I') \cdot (400 V/U')^{1.5} \cdot 1/h$	AC-1 (AC/DC)	h <sup>-1</sup>	1000					
	AC-2 (AC/DC)	h <sup>-1</sup>	1000			750		
	AC-3 (AC/DC)	h <sup>-1</sup>	1000			750		
	AC-4 (AC/DC)	h <sup>-1</sup>	300			250		
• Contactors with overload relays (mean value)		h <sup>-1</sup>	15					

<sup>1)</sup> Industrial furnaces and electric heaters with resistance heating, etc. (increased power consumption on heating up has been taken into account).

<sup>2)</sup> According to IEC 60947-4-1. For rated values for various start-up conditions see Section 3 --> "Overload Relays"

## 3RT20.4. contactors

Technical data				S3 3RT20 45	S3 3RT20 46	S3 3RT20 47	
Contactor	Size Type						
<b>General data</b>							
<b>Permissible mounting position</b> The contactors are designed for operation on a vertical mounting surface.		AC and DC operation				For DC operation and forward inclination up to 22.5°: coil voltage tolerance 0.85 ... 1.1 x U <sub>s</sub>	
Upright mounting position:		AC and DC operation		 Special design required. Positions 13 to 16 of the Order No. must be changed to <b>-1AA0</b> . Additional charge.			
<b>Mechanical endurance</b>	Basic units Basic unit with snap-on auxiliary switch block Solid-state compatible aux. switch block	Oper. cycles		10 million 10 million 5 million			
<b>Electrical endurance</b>				See page 2/123.			
<b>Rated insulation voltage U<sub>i</sub></b> (pollution degree 3)			V	1000			
<b>Rated impulse withstand voltage U<sub>imp</sub></b>			kV	6			
<b>Safe isolation</b> between coil and main contacts (acc. to DIN VDE 0106 Part 101 and A1 [draft 2/89])			V	690			
<b>Positively driven operation</b> There is positively driven operation if the NC and NO contacts cannot be closed at the same time		3RT20 4., 3RT23 4., 3RT24 5. (removable aux. switch block) 3RT20 4., 3RT23 4., 3RT24 5. (permanent aux. switch block)		Yes, between main contacts and auxiliary NC contacts and within the auxiliary switch blocks acc. to ZH 1/457, IEC 60 947-4-1, Annex H (draft 17B/996/DC) in accordance with Swiss regulations (SUVA) on request.			
<b>Permissible ambient temperature</b>		in operation when stored	°C °C	-25 ... +60 -55 ... +80			
<b>Degree of protection</b> acc. to IEC 60 947-1 and DIN 40 050				IP 20 (terminal compartment IP 00), coil system IP 40			
<b>Shock resistance</b>		Rectangular pulse Sine pulse	AC and DC operation AC and DC operation	g/ms g/ms	6.8/5 and 4/10 10.6/5 and 6.2/10		
<b>Conductor cross-sections</b>				See page 2/142.			
<b>Short-circuit protection of contactors without overload relays</b>				For short-circuit protection of contactors with overload relays, see Section 3. For short-circuit protection of fuseless load feeders, see Section 4.			
<b>Main circuit</b> Fuse links, utilization category gL/gG NH Type 3NA, DIAZED Type 5SB, NEOZED Type 5SE – acc. to IEC 60 947-4/ EN 60 947-4-4 (VDE 0660 Part 102)				Type of coord. "1"¹) Type of coord. "2"¹) Weld-free ²)	A A A	250 125 63	250 160 100
<b>Auxiliary circuit</b> Fuse links, utilization category gL/gG DIAZED Type 5SB, NEOZED Type 5SE (weld-free protection at I <sub>k</sub> ≥ 1 kA) or miniature circuit-breaker with C-characteristic (short-circuit current I <sub>k</sub> < 400 A)				A A		10 10	

1) According to excerpt from IEC 60 947-4-1 (VDE 0660 Part 102):  
Type of coordination "1":  
Destruction of the contactor and the overload relay is permissible. The contactor and/or overload relay must be replaced if necessary

Type of coordination "2":  
No damage can be tolerated to the overload relay, but contact welding on the contactor is permitted if the contacts can be easily separated.

2) Test conditions acc. to IEC 60 947-4-1.

### Conductor cross-sections

**Screw connections**  
(1 or 2 conductor connections possible)

**Main conductor:**  
With box terminal

Finely stranded with end sleeve	mm <sup>2</sup>	2.5 ... 35
Finely stranded without end sleeve	mm <sup>2</sup>	4 ... 50
Solid	mm <sup>2</sup>	2.5 ... 16
Stranded	mm <sup>2</sup>	4 ... 70
Ribbon cable (qty. × width × thickness)	mm	6 × 9 × 0.8
AWG conductor connections, solid and stranded	AWG	10 ... 2/0
- Terminal screws		
- Tightening torque	Nm	4 ... 6 (36 ... 53 lb.in)

Front terminal connected	Back terminal connected	Both terminals connected
2.5 ... 35 4 ... 50 2.5 ... 16 4 ... 70 6 × 9 × 0.8	2.5 ... 50 10 ... 50 2.5 ... 16 10 ... 70 6 × 9 × 0.8	max. 2 × 35 max. 2 × 35 max. 2 × 16 max. 2 × 50 2 × (6 × 9 × 0.8)

Connection for drilled copper bars

max. width	mm	10	If bars larger than 12 × 10 mm are connected, a 3RT19 46-4EA1 terminal cover is to comply with the phase clearance.
Without box terminal	mm <sup>2</sup>	10 ... 50 <sup>1)</sup>	If conductors larger than 25 mm <sup>2</sup> are connected, a 3RT19 46-4EA1 terminal cover is needed to comply with the phase clearance.
With cable lugs (1 or 2 conductor connections possible)	mm <sup>2</sup>	10 ... 70 <sup>1)</sup> 7 ... 1/0	

**Auxiliary conductor:**

Solid	mm <sup>2</sup>	2 × (0.5 ... 1.5); 2 × (0.75 ... 2.5) acc. to IEC 60 947; max. 2 × (0.75 ... 4)
Finely stranded with end sleeve	mm <sup>2</sup>	2 × (0.5 ... 1.5); 2 × (0.75 ... 2.5)
AWG conductor connections, solid or stranded	AWG	2 × (20 ... 16); 2 × (18 ... 14); 1 × 12
- Terminal screws		M 3
- Tightening torque	Nm	0.8 ... 1.2 (7 ... 10.3 lb.in)

**Cage Clamp connections**  
(1 or 2 conductor connections possible)

**Auxiliary conductor:**

Solid	mm <sup>2</sup>	2 × (0.25 ... 2.5)
Finely stranded with end sleeve	mm <sup>2</sup>	2 × (0.25 ... 1.5)
Finely stranded without end sleeve	mm <sup>2</sup>	2 × (0.25 ... 2.5)
AWG conductor connections, solid or stranded	AWG	2 × (24 ... 14)

- For tool for opening the Cage Clamp connection, see on accessories [page 2/79](#)
  - An "insulation stop" must be used for conductor cross-sections ≤ 1 mm<sup>2</sup>, see accessories on [page 2/79](#).
  - Max. outer diameter of conductor insulation: 3.6 mm.
  - For information about Cage Clamp connections, see Appendix page 19/17.
- 1) Only crimping cable lugs acc. to DIN 46 234

## 3RT10.5. contactors

### Technical data

Contactor	Size Type	S6 3RT10 54	S6 3RT10 55	S6 3RT10 56
-----------	-----------	-------------	-------------	-------------

### Main circuit

#### Load ratings with AC

#### AC-1 utilization category, switching resistive load

Rated operational currents $I_e$	at 40 °C up to 690 V	A	160	185	215
	at 60 °C up to 690 V	A	140	160	185
	at 60 °C up to 1000 V	A	80	90	100
Ratings of three-phase loads <sup>1)</sup> p.f. = 0.95 (at 60 °C)	at 230 V	kW	53	60	70
	400 V	kW	92	105	121
	500 V	kW	115	131	152
	690 V	kW	159	181	210
	1000 V	kW	131	148	165
Minimum conductor cross-section with $I_{e \text{ load}}$	at 40 °C	mm <sup>2</sup>	70	95	95
	60 °C	mm <sup>2</sup>	50	70	95

#### AC-2 and AC-3 utilization categories

Rated operational currents $I_e$	up to 500 V	A	115	150	185
	690 V	A	115	150	170
	1000 V	A	53	65	65
Ratings of slipring or squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	37	50	61
	400 V	kW	64	84	104
	500 V	kW	81	105	132
	690 V	kW	113	146	167
	1000 V	kW	75	90	90

#### Thermal loading capacity

10 s current <sup>2)</sup>	A	1100	1300	1480
----------------------------	---	------	------	------

#### Power loss per conducting path

at $I_e/AC-3/500$ V	W	7	9	13
---------------------	---	---	---	----

#### AC-4 utilization category (at $I_a = 6 \times I_e$ )

Rated operational current $I_e$	up to 400 V	A	97	132	160
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 400 V	kW	55	75	90
• For a contact endurance of approx. 200 000 operating cycles:					
Rated operational currents $I_e$	up to 500 V	A	54	68	81
	690 V	A	48	57	65
	1000 V	A	34	38	42
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	16	20	25
	400 V	kW	29	38	45
	500 V	kW	37	47	57
	690 V	kW	48	55	65
	1000 V	kW	49	55	60

#### AC-6a utilization category, switching three-phase transformers

with inrush	n	30	20	30	20	30	20	
Rated operational current $I_e$	up to 690 V	A	90	115	99	148	99	148
Ratings of three-phase transformers with an inrush of n = 30 or 20. The ratings must be re-calculated for other inrush factors x:	at 230 V	kVA	35	45	39	58	39	58
	400 V	kVA	62	79	68	102	68	102
	500 V	kVA	77	99	85	128	85	128
	690 V	kVA	107	137	118	176	118	176
	1000 V	kVA	80	80	98	98	117	117

#### AC-6b utilization category, switching low-inductance (low-loss, metallized-dielectric) three-phase capacitors

Ambient temperature 40 °C								
Rated operational currents $I_e$	up to 500 V	A	105	125	145			
Ratings of single capacitors or of capacitor banks (minimum inductance between parallel capacitors 6 μH) at 50 Hz, 60 Hz and	at 230 V	kvar	42	50	58			
	400 V	kvar	72	86	100			
	500 V	kvar	90	108	125			
	690 V	kvar	72	86	100			

1) Industrial furnaces and electric heaters with resistance heating, for example (higher current input allowed for during heating up).

2) Acc. to VDE 0660 Part 102. For rated values for various starting conditions, see Section 3.

## Technical data

Contactant	Size Type	<b>S6</b> <b>3RT10 54</b>	<b>S6</b> <b>3RT10 55</b>	<b>S6</b> <b>3RT10 56</b>
------------	-----------	------------------------------	------------------------------	------------------------------

### Main circuit

#### Load ratings with DC

<b>DC-1 utilization category, switching resistive load (L/R ≤ 1 ms)</b>				
<b>Rated operational current <math>I_e</math></b> (at 60 °C)				
	Number of conducting paths connected in series	1	2	3
	up to 24 V A	160	160	160
	60 V A	160	160	160
	110 V A	18	160	160
	220 V A	3.4	20	160
	440 V A	0.8	3.2	1.4
	600 V A	0.5	1.6	0.75
<b>DC-3 and DC-5 utilization categories, shunt and series motors (L/R ≤ 15 ms)</b>				
<b>Rated operational current <math>I_e</math></b> (at 60 °C)				
	Number of conducting paths connected in series	1	2	3
	up to 24 V A	160	160	160
	60 V A	7.5	160	160
	110 V A	2.5	160	160
	220 V A	0.6	2.5	160
	440 V A	0.17	0.65	11.5
	600 V A	0.12	0.37	4

#### Operating frequency

<b>Operating frequency <math>z</math></b> in operating cycles per hour			
Contactors without overload relays	No-load operating frequency 1/h	2000	2000
Dependence of the operating frequency $z'$ on the operational current $I'$ and the operational voltage $U'$ :	for AC-1 1/h	800	800
	for AC-2 1/h	400	300
	for AC-3 1/h	1000	750
	for AC-4 1/h	130	130
$z' = z \cdot \frac{I_e}{I'} \cdot \left(\frac{400 V}{U'}\right)^{1.5}$ 1/h			
Contactors with overload relays (mean value)	1/h	60	60

Contactant	Size Type	<b>S6</b> <b>3RT10 5.</b>
------------	-----------	------------------------------

### Conductor cross-sections

<b>Screw connections</b>	<b>Main conductor:</b> with 3RT19 55-4G box terminal (75 HP)		Front terminal connected	Back terminal connected	Both terminals connected
	finely stranded with end sleeve	mm <sup>2</sup>	16 ... 70	16 ... 70	max. 1 × 50, 1 × 70
	Finely stranded without end sleeve	mm <sup>2</sup>	16 ... 70	16 ... 70	max. 1 × 50, 1 × 70
	Stranded	mm <sup>2</sup>	16 ... 70	16 ... 70	max. 2 × 70
	AWG conductor connections, solid/stranded		6 ... 2/0	6 ... 2/0	max. 2 × 1/0
	Ribbon cable (qty. × width × thickness)	mm	min. 3 × 9 × 0.8	min. 3 × 9 × 0.8	max. 2 × (6 × 15.5 × 0.8)
		mm	max. 6 × 15.5 × 0.8	max. 6 × 15.5 × 0.8	
	with 3RT19 56-4G box terminal				
	Finely stranded with end sleeve	mm <sup>2</sup>	16 ... 120	16 ... 120	max. 1 × 95, 1 × 120
	Finely stranded without end sleeve	mm <sup>2</sup>	16 ... 120	16 ... 120	max. 1 × 95, 1 × 120
Stranded	mm <sup>2</sup>	16 ... 120	16 ... 120	max. 2 × 120	
AWG conductor connections, solid/stranded		6 ... 250 kcmil	6 ... 250 kcmil	max. 2 × 3/0	
Ribbon cable (qty. × width × thickness)	mm	min. 3 × 9 × 0.8	min. 3 × 9 × 0.8		
	mm	max. 10 × 15.5 × 0.8	max. 10 × 15.5 × 0.8	max. 2 × (10 × 15.5 × 0.8)	
- Terminal screws		M 10 (hexagon socket, A/F4)			
- Tightening torque	Nm	10 ... 12 (90 ... 110 lb.in)			
<b>Without box terminal/busbar connection</b>					
Finely stranded with cable lug	mm <sup>2</sup>	16 ... 95	If cable lugs acc. to DIN 46 235 are connected, as of a conductor cross-section of 95 mm <sup>2</sup> a 3RT19 56-4EA1 terminal cover is necessary to comply with the phase clearance.		
Stranded with cable lug	mm <sup>2</sup>	25 ... 120			
AWG conductor connections, solid or stranded	AWG	4 ... 250 kcmil			
Connecting bar (max. width)	mm	17			
- Terminal screws		M 8 × 25 (A/F 13)			
- Tightening torque	Nm	10 ... 14 (89 ... 124 lb.in)			
<b>Auxiliary conductor:</b>					
Solid	mm <sup>2</sup>	2 × (0.5 ... 1.5); 2 × (0.75 ... 2.5) acc. to IEC 60 947; max. 2 × (0.75 ... 4)			
Finely stranded with end sleeve	mm <sup>2</sup>	2 × (0.5 ... 1.5); 2 × (0.75 ... 2.5)			
AWG conductor connections, solid or stranded	AWG	2 × (18 ... 14)			
- Terminal screws		M 3 (PZ 2)			
- Tightening torque	Nm	0.8 ... 1.2 (7 ... 10.3 lb.in)

## 3RT10.6. contactors

CONTACTORS AND ASSEMBLIES 2

### Technical data

Contactors	Size Type	<b>S10 3RT10 64</b>	<b>S10 3RT10 65</b>	<b>S10 3RT10 66</b>
------------	-----------	-------------------------	-------------------------	-------------------------

### General data

**Permissible mounting position**

The contactors are designed for operation on a vertical mounting surface.

**Mechanical endurance**

Oper. cycles 10 million

**Electrical endurance**

See page 2/123

**Rated insulation voltage  $U_i$**  (pollution degree 3)

V 1000

**Rated impulse withstand voltage  $U_{imp}$**

kV 8

**Safe isolation** between coil, auxiliary contacts and main contacts (acc. to DIN VDE 0106 Part 101 and A1 [draft 2/89])

V 690

**Positively driven operation**

There is positively driven operation if the NC and NO contacts cannot be closed at the same time

Yes, between main contacts and auxiliary NC contacts and within the auxiliary switch blocks acc. to ZH 1/457, IEC 60 947-4-1, Annex H (draft 17B/996/DC)

**Permissible ambient temperature**

in operation °C -25 ... +60/+55 with AS-Interface  
when stored °C -55 ... +80

**Degree of protection** acc. to IEC 60 947-1 and DIN 40 050

IP 00/open type, coil system IP 20

**Shock resistance**

Rectangular pulse  
Sine pulse

g/ms 8.5/5 and 4.2/10  
g/ms 13.4/5 and 6.5/10

**Conductor cross-sections**

See page 2/148

**Electromagnetic compatibility (EMC)**

See page 2/106

### Short-circuit protection

**Main circuit**

Fuse links, utilization category gL/gG  
NH Type 3NA, DIAZED Type 5SB, NEOZED Type 5SE  
- acc. to IEC 60 947-4-1/EN 60 947-4-1

Type of coord. "1"¹) A 500  
Type of coord. "2"¹) A 400  
Weld-free²) A 250

**Auxiliary circuit**

Fuse links, utilization category gL/gG  
(weld-free protection at  $I_k \geq 1$  kA)  
DIAZED Type 5SB, NEOZED Type 5SE  
or miniature circuit-breaker with C-characteristic ( $I_k < 400$  A)

A 10

Contactors	Size Type	<b>S10 3RT10 6.</b>
------------	-----------	-------------------------

### Control circuit

**Coil voltage tolerance**

AC/DC (UC)

$0.8 \times U_{s \min} \dots 1.1 \times U_{s \max}$

**Power consumption of solenoid mechanism**

(with coil in cold state and rated range  $U_{s \min} \dots U_{s \max}$ )

		Conventional op. mechanism		Solid-state op. mechanism	
		$U_{s \min}$	$U_{s \max}$	$U_{s \min}$	$U_{s \max}$
AC operation	closing	490	590	400	530
	p.f.	0.9	0.9	0.8	0.8
	closed	5.6	6.7	4	5
DC operation	p.f.	0.9	0.9	0.5	0.4
	closing	540	650	440	580
	closed	6.1	7.4	3.2	3.8

**PLC control input** (EN 61 131-2/Type 2)

DC 24 V /  $\leq 30$  mA

**Operating times**

(Break-time = opening time + arcing time)

		Conventional op. mechanism		Solid-state op. mechanism	
				Operation via A1/A2	PLC input
- at $0.8 \times U_{s \min} \dots 1.1 \times U_{s \max}$	closing time	30 ... 95		105 ... 145	45 ... 80
	opening time	40 ... 80		80 ... 100	80 ... 100
- at $U_{s \min} \dots U_{s \max}$	closing time	35 ... 50		110 ... 130	50 ... 65
	opening time	50 ... 80		80 ... 100	80 ... 100
Arcing time		10 ... 15		10 ... 15	10 ... 15

1) According to excerpt from IEC 60 947-4-1 (VDE 0660 Part 102):  
Type of coordination "1":  
Destruction of the contactor and the overload relay is permissible. The contactor and/or overload relay must be replaced if necessary.

Type of coordination "2":  
No damage can be tolerated to the overload relay, but contact welding on the contactor is permitted if the contacts can be easily separated.

2) Test conditions acc. to IEC 60 947-4-1.

## 3RT10.6. contactors

### Technical data

Contactor	Size Type	S10 3RT10 64	S10 3RT10 65	S10 3RT10 66
-----------	-----------	--------------	--------------	--------------

#### Main circuit

##### Load ratings with AC

##### AC-1 utilization category, switching resistive load

Rated operational currents $I_e$	at 40 °C up to 690 V	A	275	330	
	at 60 °C up to 690 V	A	250	300	
	at 60 °C up to 1000 V	A	100	150	
Ratings of three-phase loads <sup>1)</sup> p.f. = 0.95 (at 60 °C)	at 230 V	kW	94	113	
	400 V	kW	164	197	
	500 V	kW	205	246	
	690 V	kW	283	340	
	1000 V	kW	164	246	
Minimum conductor cross-section with $I_{e \text{ load}}$	at 40 °C	mm <sup>2</sup>	150	185	
	60 °C	mm <sup>2</sup>	120	185	

##### AC-2 and AC-3 utilization categories

Rated operational currents $I_e$	up to 500 V	A	225	265	300
	690 V	A	225	265	280
	1000 V	A	68	95	95
Ratings of slipping or squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	73	85	97
	400 V	kW	128	151	171
	500 V	kW	160	189	215
	690 V	kW	223	265	280
	1000 V	kW	90	132	132

##### Thermal loading capacity

10 s current <sup>2)</sup>	A	1800	2400	2400
----------------------------	---	------	------	------

##### Power loss per conducting path

at $I_e/AC-3/500$ V	W	17	18	22
---------------------	---	----	----	----

##### AC-4 utilization category (at $I_a = 6 \times I_e$ )

Rated operational current $I_e$	up to 400 V	A	195	230	280
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 400 V	kW	110	132	160
• For a contact endurance of approx. 200 000 operating cycles:					
Rated operational currents $I_e$	up to 500 V	A	96	117	125
	690 V	A	85	105	115
	1000 V	A	42	57	57
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	30	37	40
	400 V	kW	54	66	71
	500 V	kW	67	82	87
	690 V	kW	82	102	112
	1000 V	kW	59	80	80

##### AC-6a utilization category, switching three-phase transformers

with inrush	n	30	20	30	20	30	20	
Rated operational current $I_e$	up to 690 V	A	151	227	182	265	182	273
Ratings of three-phase transformers with an inrush of n = 30 or 20. The ratings must be re-calculated for other inrush factors x:	at 230 V	kVA	60	90	72	105	72	109
	400 V	kVA	105	157	126	183	126	189
	500 V	kVA	130	196	158	229	158	236
	690 V	kVA	180	271	217	317	217	326
	1000 V	kVA	117	117	164	164	164	164
$P_x = P_{n30} \cdot \frac{30}{x}$								

##### AC-6b utilization category, switching low-inductance (low-loss, metallized-dielectric) three-phase capacitors

Ambient temperature 40 °C							
Rated operational currents $I_e$	up to 500 V	A	183	220			
Ratings of single capacitors or of capacitor banks (minimum inductance between parallel capacitors 6 µH) at 50 Hz, 60 Hz and	at 230 V	kvar	73	88			
	400 V	kvar	127	152			
	500 V	kvar	159	191			
	690 V	kvar	127	152			

1) Industrial furnaces and electric heaters with resistance heating, for example (higher current input allowed for during heating up).

2) Acc. to VDE 0660 Part 102. For rated values for various starting conditions, see Section 3.

Arcing time		10 ... 15	10 ... 15

1) According to excerpt from IEC 60 947-4-1 (VDE 0660 Part 102):  
Type of coordination "1":  
Destruction of the contactor and the overload relay is permissible. The contactor and/or overload relay must be replaced if necessary.

Type of coordination "2":  
No damage can be tolerated to the overload relay, but contact welding on the contactor is permitted if the contacts can be easily separated.

2) Test conditions acc. to IEC 60 947-4-1.

## 3RT10.7. contactors

CONTACTORS AND ASSEMBLIES 2

### Technical data

Contactor	Size Type	S12 3RT10 75	S12 3RT10 76
-----------	-----------	-----------------	-----------------

### Main circuit

#### Load ratings with AC

#### AC-1 utilization category, switching resistive load

Rated operational currents $I_e$	at 40 °C up to 690 V	A	430	610
	at 60 °C up to 690 V	A	400	550 <sup>3)</sup>
	at 60 °C up to 1000 V	A	200	200
Ratings of three-phase loads <sup>1)</sup> p.f. = 0.95 (at 60 °C)	at 230 V	kW	151	208
	400 V	kW	263	362
	500 V	kW	329	452
	690 V	kW	454	624
	1000 V	kW	329	329
Minimum conductor cross-section with $I_{e \text{ load}}$	at 40 °C	mm <sup>2</sup>	2 × 150	2 × 185
	60 °C	mm <sup>2</sup>	240	2 × 185

#### AC-2 and AC-3 utilization categories

Rated operational currents $I_e$	up to 500 V	A	400	500 <sup>4)</sup>
	690 V	A	400	450
	1000 V	A	180	180
Ratings of slipring or squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	132	164
	400 V	kW	231	291
	500 V	kW	291	363
	690 V	kW	400	453
	1000 V	kW	250	250

#### Thermal loading capacity

10 s current <sup>2)</sup>	A	3200	4000
----------------------------	---	------	------

#### Power loss per conducting path

at $I_e/AC-3/500$ V	W	35	55
---------------------	---	----	----

#### AC-4 utilization category (at $I_a = 6 \times I_e$ )

Rated operational current $I_e$	up to 400 V	A	350	430
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 400 V	kW	200	250
• For a contact endurance of approx. 200 000 operating cycles:				
Rated operational currents $I_e$	up to 500 V	A	150	175
	690 V	A	135	150
	1000 V	A	80	80
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	48	56
	400 V	kW	85	98
	500 V	kW	105	123
	690 V	kW	133	148
	1000 V	kW	113	113

#### AC-6a utilization category, switching three-phase transformers

with inrush	n	30	20	30	20	
Rated operational current $I_e$	up to 690 V	A	251	377	270	404
Ratings of three-phase transformers with an inrush of $n = 30$ or $20$ . The ratings must be re-calculated for other inrush factors x:	at 230 V	kVA	100	150	107	161
	400 V	kVA	173	261	187	280
	500 V	kVA	217	326	234	350
	690 V	kVA	300	450	323	483
	1000 V	kVA	311	311	311	311

$$P_x = P_{n30} \cdot \frac{30}{x}$$

#### AC-6b utilization category, switching low-inductance (low-loss, metallized-dielectric) three-phase capacitors

Ambient temperature 40 °C					
Rated operational currents $I_e$	up to 500 V	A	287	407	
Ratings of single capacitors or of capacitor banks (minimum inductance between parallel capacitors 6 μH) at 50 Hz, 60 Hz and	at 230 V	kvar	114	162	
	400 V	kvar	199	282	
	500 V	kvar	248	352	
	690 V	kvar	199	282	

1) Industrial furnaces and electric heaters with resistance heating, for example (higher current input allowed for during heating up).

2) Acc. to VDE 0660 Part 102. For rated values for various starting conditions, see Section 3.

3) Ambient temperature 50 °C for 3RT10 76-.N contactor

4) Ambient temperature 55 °C for 3RT10 76-.N contactor

# Contactors for Switching Motors

## 3RT10.7. contactors

### Technical data

Contactor	Size Type	S12 3RT10 75	S12 3RT10 76
-----------	-----------	-----------------	-----------------

### Main circuit

#### Load ratings with DC

DC-1 utilization category, switching resistive load (L/R ≤ 1 ms)		Number of conducting paths connected in series		
Rated operational current $I_e$ (at 60 °C)		1	2	3
up to 24 V	A	400	400	400
60 V	A	330	400	400
110 V	A	33	400	400
220 V	A	3.8	400	400
440 V	A	0.9	4	11
600 V	A	0.6	2	5.2

DC-3 and DC-5 utilization categories, shunt and series motors (L/R ≤ 15 ms)		Number of conducting paths connected in series		
Rated operational current $I_e$ (at 60 °C)		1	2	3
up to 24 V	A	400	400	400
60 V	A	11	400	400
110 V	A	3	400	400
220 V	A	0.6	2.5	400
440 V	A	0.18	0.65	1.4
600 V	A	0.125	0.37	0.75

#### Operating frequency

Operating frequency $z$ in operating cycles per hour		No-load operating frequency	
Contactor without overload relays	1/h	2000	2000
Dependence of the operating frequency $z'$ on the operational current $I'$ and the operational voltage $U'$ :	for AC-1	700	500
	for AC-2	200	170
	for AC-3	500	420
	for AC-4	130	130
$z' = z \cdot \frac{I_e}{I'} \cdot \left(\frac{400V}{U'}\right)^{1.5}$ 1/h			
Contactor with overload relays (mean value)	1/h	60	60

Contactor	Size Type	S12 3RT10 7.
-----------	-----------	-----------------

### Conductor cross-sections

Screw connections		Front terminal connected	Back terminal connected	Both terminals connected
<b>Main conductor:</b> with 3RT19 66-4G box terminal				
Finely stranded with end sleeve	mm <sup>2</sup>	70 ... 240 	120 ... 185 	min. 2 × 50, max. 2 × 185 
Finely stranded without end sleeve	mm <sup>2</sup>	70 ... 240	120 ... 185	min. 2 × 50, max. 2 × 185
Stranded	mm <sup>2</sup>	95 ... 300	120 ... 240	min. 2 × 70, max. 2 × 240
AWG conductor connections, solid or stranded	AWG	3/0 ... 600 kcmil	250 ... 500 kcmil	min. 2 × 2/0, max. 2 × 500 kcmil
Ribbon cable (qty. × width × thickness)	mm	min. 6 × 9 × 0.8	min. 6 × 9 × 0.8	max. 2 × (20 × 24 × 0.5)
- Terminal screws	mm	max. 20 × 24 × 0.5	max. 20 × 24 × 0.5	
- Tightening torque	Nm	M 12 (hexagon socket, A/F 5)		
		20 ... 22 (180 ... 195 lb.in)		
<b>Without box terminal/busbar connection</b>				
Finely stranded with cable lug	mm <sup>2</sup>	50 ... 240	If cable lugs acc. to DIN 46 234 are connected, as of a conductor cross-section of 240 mm <sup>2</sup> and acc. to DIN 46 235 as of a conductor cross-section of 185 mm <sup>2</sup> a 3RT19 66-4EA1 terminal cover is necessary to comply with the phase clearance.	
Stranded with cable lug	mm <sup>2</sup>	70 ... 240		
AWG conductor connections, solid or stranded	AWG	2/0 ... 500 kcmil		
Connecting bar (max. width)	mm	25		
- Terminal screws		M 10 × 30 (A/F 17)		
- Tightening torque	Nm	14 ... 24 (124 ... 210 lb.in)		
<b>Auxiliary conductor:</b>				
Solid	mm <sup>2</sup>	2 × (0.5 ... 1.5); 2 × (0.75 ... 2.5) acc. to IEC 60 947;		
Finely stranded with end sleeve	mm <sup>2</sup>	max. 2 × (0.75 ... 4)		
		2 × (0.5 ... 1.5); 2 × (0.75 ... 2.5)		
AWG conductor connections, solid or stranded	AWG	2 × (18 ... 14)		
- Terminal screws		M 3 (PZ 2)		
- Tightening torque	Nm	0.8 ... 1.2 (7 ... 10.3 lb.in)

1) According to excerpt from IEC 60 947-4-1 (VDE 0660 Part 102):  
Type of coordination "1":  
Destruction of the contactor and the overload relay is permissible. The contactor and/or overload relay must be replaced if necessary.

Type of coordination "2":  
No damage can be tolerated to the overload relay, but contact welding on the contactor is permitted if the contacts can be easily separated.

2) Test conditions acc. to IEC 60 947-4-1.

# Contactors for Switching Motors

## 3RT12.6. vacuum contactors

### Technical data

Contactor	Size Type	S10 3RT12 64	S10 3RT12 65	S10 3RT12 66
-----------	-----------	--------------	--------------	--------------

### Main circuit

#### Load ratings with AC

##### AC-1 utilization category, switching resistive load

Rated operational currents $I_e$	at 40 °C up to 1000 V	A	330		
	at 60 °C up to 1000 V	A	300		
Ratings of three-phase loads <sup>1)</sup> p.f. = 0.95 (at 60 °C)	at 230 V	kW	113		
	400 V	kW	197		
	500 V	kW	246		
	690 V	kW	340		
	1000 V	kW	492		
Minimum conductor cross-section with $I_{e,load}$	at 40 °C	mm <sup>2</sup>	185		
	60 °C	mm <sup>2</sup>	185		

##### AC-2 and AC-3 utilization categories

Rated operational currents $I_e$	up to 1000 V	A	225	265	300
Ratings of slipring or squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	73	85	97
	400 V	kW	128	151	171
	500 V	kW	160	189	215
	690 V	kW	223	265	288
	1000 V	kW	320	378	428

##### Thermal loading capacity

10 s current <sup>2)</sup>	A	1800	2120	2400
----------------------------	---	------	------	------

##### Power loss per conducting path

at $I_e/AC-3$	W	9	12	14
---------------	---	---	----	----

##### AC-4 utilization category (at $I_a = 6 \times I_e$ )

Rated operational current $I_e$	up to 690 V	A	195	230	280
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 400 V	kW	110	132	160
• For a contact endurance of approx. 400 000 operating cycles:					
Rated operational currents $I_e$	up to 690 V	A	97	115	140
	1000 V	A	68	81	98
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	30	37	45
	400 V	kW	55	65	79
	500 V	kW	68	81	98
	690 V	kW	94	112	138
	1000 V	kW	95	114	140

##### AC-6a utilization category, switching three-phase transformers

with inrush	n	30	20		
Rated operational current $I_e$	up to 690 V	A	185	278	
Ratings of three-phase transformers with an inrush of n = 30 or 20. The ratings must be re-calculated for other inrush factors x:	at 230 V	kVA	74	111	
	400 V	kVA	128	193	
	500 V	kVA	160	241	
	690 V	kVA	221	332	
	1000 V	kVA	320	482	
$P_x = P_{n30} \cdot \frac{30}{x}$					

##### AC-6b utilization category, switching low-inductance (low-loss, metallized-dielectric) three-phase capacitors

Ambient temperature 40 °C					
Rated operational currents $I_e$	up to 500 V	A	220		
Ratings of single capacitors or of capacitor banks (minimum inductance between parallel capacitors 6 µH) at 50 Hz, 60 Hz and	at 230 V	kvar	88		
	400 V	kvar	152		
	500 V	kvar	191		
	690 V	kvar	152		

#### Operating frequency

<b>Operating frequency z</b> in operating cycles per hour					
Contactors without overload relays	No-load operating frequency	1/h	2000	2000	
Dependence of the operating frequency z' on the operational current I' and the operational voltage U':	for AC-1	1/h	800	750	
	for AC-2	1/h	300	250	
	for AC-3	1/h	750	750	
	for AC-4	1/h	250	250	
	$z' = z \cdot \frac{I_e}{I'} \cdot \left( \frac{400 V}{U'} \right)^{1.5}$ 1/h				
Contactors with overload relays (mean value)		1/h	60	60	

1) Industrial furnaces and electric heaters with resistance heating, for example (higher current input allowed for during heating up).

2) Acc. to VDE 0660 Part 102. For rated values for various starting conditions, see Section 3.

1) According to excerpt from IEC 60 947-4-1 (VDE 0660 Part 102):  
Type of coordination "1":  
Destruction of the contactor and the overload relay is permissible. The contactor and/or overload relay must be replaced if necessary.

Type of coordination "2":  
No damage can be tolerated to the overload relay, but contact welding on the contactor is permitted if the contacts can be easily separated.

2) Test conditions acc. to IEC 60 947-4-1.

# Contactors for Switching Motors

## 3RT12.7. vacuum contactors

### Technical data

Contactors	Size Type	S12 3RT12 75	S12 3RT12 76
------------	-----------	-----------------	-----------------

### Main circuit

#### Load ratings with AC

##### AC-1 utilization category, switching resistive load

Rated operational currents $I_e$	at 40 °C up to 1000 V	A	610	
	at 60 °C up to 1000 V	A	550	
Ratings of three-phase loads 1) p.f. = 0.95 (at 60 °C)	at 230 V	kW	208	
	400 V	kW	362	
	500 V	kW	452	
	690 V	kW	624	
	1000 V	kW	905	
Minimum conductor cross-section with $I_{e,load}$	at 40 °C	mm <sup>2</sup>	2 × 185	
	60 °C	mm <sup>2</sup>	2 × 185	

##### AC-2 and AC-3 utilization categories

Rated operational currents $I_e$	up to 1000 V	A	400	500
Ratings of slipring or squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	132	164
	400 V	kW	231	291
	500 V	kW	291	363
	690 V	kW	400	507
	1000 V	kW	578	728

##### Thermal loading capacity

	10 s current 2)	A	3200	4000
--	-----------------	---	------	------

##### Power loss per conducting path

	at $I_e/AC-3$	W	21	32
--	---------------	---	----	----

##### AC-4 utilization category (at $I_a = 6 \times I_e$ )

Rated operational current $I_e$	up to 690 V	A	350	430
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 400 V	kW	200	250

• For a contact endurance of approx. 400 000 operating cycles:

Rated operational currents $I_e$	up to 690 V	A	175	215
	1000 V	A	123	151
Ratings of squirrel-cage motors at 50 Hz and 60 Hz	at 230 V	kW	56	70
	400 V	kW	98	122
	500 V	kW	124	153
	690 V	kW	172	212
	1000 V	kW	183	217

##### AC-6a utilization category, switching three-phase transformers

with inrush		n	30	20
Rated operational current $I_e$	up to 690 V	A	279	419
Ratings of three-phase transformers with an inrush of n = 30 or 20. The ratings must be re-calculated for other inrush factors x:	at 230 V	kVA	111	167
	400 V	kVA	193	290
	500 V	kVA	241	363
	690 V	kVA	332	501
	1000 V	kVA	482	726

$$P_x = P_{n,30} \cdot \frac{30}{x}$$

##### AC-6b utilization category, switching low-inductance (low-loss, metallized-dielectric) three-phase capacitors

Ambient temperature 40 °C				
Rated operational currents $I_e$	up to 500 V	A	407	
Ratings of single capacitors or of capacitor banks (minimum inductance between parallel capacitors 6 µH) at 50 Hz, 60 Hz and	at 230 V	kvar	162	
	400 V	kvar	282	
	500 V	kvar	352	
	690 V	kvar	282	

#### Operating frequency

##### Operating frequency z in operating cycles per hour

Contactors without overload relays	No-load operating frequency	1/h	2000	
Dependence of the operating frequency z' on the operational current I' and the operational voltage U':	for AC-1	1/h	700	
	for AC-2	1/h	250	
	for AC-3	1/h	750	
	for AC-4	1/h	250	
$z' = z \cdot \frac{I_e}{I'} \cdot \left(\frac{400 V}{U'}\right)^{1.5}$		1/h		
Contactors with overload relays (mean value)		1/h	60	

1) Industrial furnaces and electric heaters with resistance heating, for example (higher current input allowed for during heating up).

2) Acc. to VDE 0660 Part 102. For rated values for various starting conditions, see Section 3.

# Contactors for Switching Motors

## 3RT24 contactors, 3-pole, for switching resistive loads (AC-1)

Technical data																																												
Contactor	Size	<b>S3</b>																																										
	Type	<b>3RT24 46</b>																																										
General data																																												
<b>Permissible mounting position</b>		AC and DC operation																																										
The contactors are designed for operation on a vertical mounting surface.																																												
Upright mounting position:																																												
	AC operation		Special design required. Positions 13 ... 16 of the Order No. must be changed to <b>-1AA0</b> . Additional charge.																																									
	DC operation		-																																									
<b>Mechanical endurance</b>		Oper. cycles	10 million																																									
<b>Electrical endurance</b>		Oper. cycles	0.5 million																																									
AC-1 utilization category at $I_e$																																												
<b>Rated insulation voltage <math>U_i</math></b> (pollution degree 3)		V	1000																																									
<b>Rated impulse withstand voltage <math>U_{imp}</math></b>		kV	6																																									
<b>Safe isolation</b> between coil and main contacts (acc. to DIN VDE 0106 Part 101 and A1 [draft 2/89])		V	690																																									
<b>Permissible ambient temperature</b>		in operation	°C	-25 ... +60																																								
		when stored	°C	-55 ... +80																																								
<b>Degree of protection</b> acc. to IEC 60 947-1 and DIN 40 050		IP 20 (terminal compartment IP 00), coil system IP 40																																										
Shock resistance																																												
Rectangular pulse	AC and DC operation	g/ms	6.8/5 and 4/10																																									
Sine pulse	AC and DC operation	g/ms	10.6/5 and 6.2/10																																									
<b>Conductor cross-sections</b>		See page 2/160																																										
Short-circuit protection of contactors without overload relays																																												
Main circuit																																												
Fuse links, utilization category gL/gG NH, Type 3NA		Type of coord. "1" 2)	A	250																																								
Fuse links, utilization category gR SITOR, Type 3NE		Type of coord. "2" 2)	A	250																																								
Auxiliary circuit																																												
Fuse links, utilization category gL/gG (weld-free protection at $I_k \geq 1$ kA) DIAZED Type 5SB, NEOZED Type 5SE			A	10																																								
or miniature circuit-breaker with C-characteristic ( $I_k < 400$ A)			A	10																																								
Control circuit																																												
<b>Coil voltage tolerance</b>		AC/DC	0.8 ... 1.1 × $U_s$

DC operation	closing time	ms	100 ... 120																																									
	opening time	ms	16 ... 20																																									

1) The opening times of the NO contacts and the closing times of the NC contacts increase if the contactor coils are protected against voltage peaks: varistor +2 ms to 5 ms, diode assemblies 2 to 6 times.

2) According to excerpt from IEC 60 947-4-1 (VDE 0660 Part 102): Type of coordination "1": Destruction of the contactor and the overload relay is permissible. The contactor and/or overload relay must be replaced if necessary.

Type of coordination "2": No damage can be tolerated to the overload relay, but contact welding on the contactor is permitted if the contacts can be easily separated.

# Contactors for Special Applications

## 3RT24 contactors, 3-pole, for switching resistive loads (AC-1)

### Technical data

Contactors	Size Type	<b>S3</b> <b>3RT24 46</b>
------------	-----------	------------------------------

### Main circuit

#### Load ratings with AC

##### AC-1 utilization category, switching resistive load

Rated operational currents $I_e$	at 40 °C up to 690 V	A	140
	at 60 °C up to 690 V	A	130
	at 1000 V	A	60
Ratings of three-phase loads p.f. = 0.95 (at 60 °C)	at 230 V	kW	50
	400 V	kW	86
	500 V	kW	107
	690 V	kW	148
	1000 V	kW	98
Minimum conductor cross-section with $I_{e\text{load}}$	at 40 °C	mm <sup>2</sup>	50
	at 60 °C	mm <sup>2</sup>	50

##### AC-2 and AC-3 utilization categories

With an electrical endurance of 1.3 million operating cycles

Rated operational current $I_e$	up to 690 V	A	44
Ratings of slipring or squirrel-cage motors at 50 Hz and 60 Hz (at 60 °C)	at 230 V	kW	12.7
	400 V	kW	22
	500 V	kW	29.9
	690 V	kW	38.2

Power loss per conducting path	at $I_e/AC-1$	W	12.5
--------------------------------	---------------	---	------

#### Load ratings with DC

##### DC-1 utilization category, switching resistive load L/R ≤ 1 ms)

Number of conducting paths when connected in series

			1	2	3
Rated operational currents $I_e$ (at 60 °C)	up to 24 V	A	130	130	130
	60 V	A	80	130	130
	110 V	A	12	130	130
	220 V	A	2.5	13	130
	440 V	A	0.8	2.4	6
	600 V	A	0.48	1.3	3.4

##### DC-3 and DC-5 utilization categories, shunt and series motors

Number of conducting paths when connected in series

			1	2	3
Rated operational currents $I_e$ (at 60 °C)	up to 24 V	A	6	130	130
	60 V	A	3	130	130
	110 V	A	1.25	130	130
	220 V	A	0.35	1.75	4
	440 V	A	0.15	0.42	0.8
	600 V	A	0.1	0.27	0.45

#### Operating frequency

Operating frequency $z$ in operating cycles per hour				AC operation	DC operation
Contactors without overload relays	No-load operating frequency	1/h		5000	1000
Rated operation	for AC-1	1/h		650	650
	for AC-3	1/h		1000	1000

Dependence of the operating frequency  $z'$  on the operational current  $I'$  and the operational voltage  $U'$ :

$$z' = z \cdot \frac{I_e}{I'} \cdot \left( \frac{400V}{U'} \right)^{1.5} \quad 1/h$$

## 3RT14 contactors, 3-pole, for switching resistive loads (AC-1)

CONTACTORS AND ASSEMBLIES 2

### Technical data

Contactor	Size Type	<b>S6</b> <b>3RT14 56</b>
-----------	-----------	------------------------------

### Main circuit

#### Load ratings with AC

##### AC-2 and AC-3 utilization category

With an electrical endurance of 1.3 million operating cycles

Rated operational current $I_e$	up to 690 V	A	97
Ratings of slipping or squirrel-cage motors at 50 Hz and 60 Hz (at 60°C)	at 230 V	kW	30
	400 V	kW	55
	500 V	kW	55
	690 V	kW	90

#### Load ratings with DC

##### DC-1 utilization category, switching resistive load ( $L/R \leq 1$ ms)

Number of conducting paths connected in series

				1	2	3
Rated operational currents $I_e$ (at 60°C)	up to 24 V	A		315	315	315
	60 V	A		315	315	315
	110 V	A		18	315	315
	220 V	A	3.4		20	315
	440 V	A	0.8		3.2	11.5
	600 V	A	0.5		1.6	4

##### DC-3 and DC-5 utilization categories, shunt and series motors ( $L/R \leq 15$ ms)

Number of conducting paths connected in series

				1	2	3
Rated operational currents $I_e$ (at 60°C)	up to 24 V	A		315	315	315
	60 V	A	7.5		315	315
	110 V	A	2.5		315	315
	220 V	A	0.6		2.5	315
	440 V	A	0.17		0.65	1.4
	600 V	A	0.12		0.37	0.75

### Operating frequency

#### Operating frequency $z$ in operating cycles per hour

Contactors without overload relays	No-load op. frequency	for AC-1	1/h	2000
		for AC-3	1/h	600
			1/h	1000

Dependence of the operating frequency  $z'$  on the operational current  $I'$  and operational voltage  $U'$ :

$$z' = z \cdot \frac{I_e}{I'} \cdot \left( \frac{400V}{U'} \right)^{1.5} \quad 1/h$$

### Conductor cross-sections

#### Screw connections

##### Main conductor:

with 3RT19 55-4G box terminal

Finely stranded with end sleeve	mm <sup>2</sup>	10 ... 70
Finely stranded without end sleeve	mm <sup>2</sup>	10 ... 70
Stranded	mm <sup>2</sup>	16 ... 70
AWG conductor connections, solid or stranded		6 ... 2/0
Ribbon cable (qty. x width x thickness)	mm	min. 3 x 9 x 0.8
	mm	max. 6 x 15.5 x 0.8

with 3RT19 56-4G box terminal

Finely stranded with/without end sleeve	mm <sup>2</sup>	10 ... 120
Stranded	mm <sup>2</sup>	16 ... 120
AWG conductor connections, solid or stranded	AWG	6 ... 250 kcmil
Ribbon cable (qty. x width x thickness)	mm	min. 3 x 9 x 0.8
	mm	max. 10 x 15.5 x 0.8

– Terminal screws

– Tightening torque

Without box terminal/busbar connection

Finely stranded with cable lug	mm <sup>2</sup>	16 ... 95
Stranded with cable lug	mm <sup>2</sup>	25 ... 120
AWG conductor connections, solid or stranded	AWG	4 ... 250 kcmil
Connecting bar (max. width)	mm	17
– Terminal screws		M 8 x 25 (A/F 13)
– Tightening torque	Nm	10 ... 14 (89 ... 124 lb.in)

##### Auxiliary conductor:

Solid	mm <sup>2</sup>	2 x (0.5 ... 1.5); 2 x (0.75 ... 2.5) acc. to IEC 60 947; max. 2 x (0.75 ... 4)
Finely stranded with end sleeve	mm <sup>2</sup>	2 x (0.5 ... 1.5); 2 x (0.75 ... 2.5)
AWG conductor connections, solid or stranded	AWG	2 x (18 ... 14)
– Terminal screws		M 3 (PZ2)
– Tightening torque	Nm	0.8 ... 1.2 (7 ... 10.3 lb.in)

Front terminal connected	Back terminal connected	Both terminals connected
10 ... 70 10 ... 70 16 ... 70 6 ... 2/0	10 ... 70 10 ... 70 16 ... 70 6 ... 2/0	max. 1x50, 1x70 max. 1x50, 1x70 max. 2 x 70 max. 2 x 1/0
min. 3 x 9 x 0.8 max. 6 x 15.5 x 0.8	min. 3 x 9 x 0.8 max. 6 x 15.5 x 0.8	max. 2 x (6 x 15.5 x 0.8)
10 ... 120 16 ... 120 6 ... 250 kcmil	10 ... 120 16 ... 120 6 ... 250 kcmil	max. 1 x 95, 1 x 120 max. 2 x 120 max. 2 x 3/0
min. 3 x 9 x 0.8 max. 10 x 15.5 x 0.8	min. 3 x 9 x 0.8 max. 10 x 15.5 x 0.8	max. 2 x (10 x 15.5 x 0.8)
M 10 (hexagon socket, A/F4)		
10 ... 12 (90 ... 110 lb.in)		
16 ... 95 25 ... 120 4 ... 250 kcmil	If cable lugs acc. to DIN 46 235 are connected, as of a conductor cross-section of 95 mm <sup>2</sup> a 3RT19 56-4EA1 terminal cover is necessary to comply with the phase clearance.	
17		
M 8 x 25 (A/F 13)		
10 ... 14 (89 ... 124 lb.in)

1) Ambient temperature 50 °C for 3RT14 76-N contactor

# Contactors for Special Applications

## 3RT14 contactors, 3-pole, for switching resistive loads (AC-1)

Technical data		S10 3RT14 66	S12 3RT14 76
Contactors	Size Type		
<b>Main circuit</b>			
<i>Operating frequency</i>			
<b>Operating frequency z</b> in operating cycles per hour			
Contactors without overload relays	No-load op. frequency	1/h	2000
	for AC-1	1/h	600
	for AC-3	1/h	1000
Dependence of the operating frequency z' on the operational current I' and operational voltage U':			
$z' = z \cdot \frac{I_e}{I'} \cdot \left( \frac{400V}{U'} \right)^{1.5} \text{ 1/h}$			
<b>Conductor cross-sections</b>			
<b>Screw connections</b>	<b>Main conductor:</b> with 3RT19 66-4G box terminal	Front terminal connected	Back terminal connected
	Finely stranded with end sleeve	mm <sup>2</sup> 70 ... 240	mm <sup>2</sup> 120 ... 185
	Finely stranded without end sleeve	mm <sup>2</sup> 70 ... 240	mm <sup>2</sup> 120 ... 185
	Stranded	mm <sup>2</sup> 95 ... 300	mm <sup>2</sup> 120 ... 240
	AWG conductor connections, solid or stranded	3/0 ... 600 kcmil	250 ... 500 kcmil
	Ribbon cable (qty. x width x thickness)	mm min. 6 x 9 x 0.8 mm max. 20 x 24 x 0.5	mm min. 6 x 9 x 0.8 mm max. 20 x 24 x 0.5
	– Terminal screws	M 12 (hexagon socket, A/F 5)	
	– Tightening torque	Nm 20 ... 22 (180 ... 195 lb.in)	
	<u>Without box terminal/busbar connection</u>		
	Finely stranded with cable lug	mm <sup>2</sup> 50 ... 240	If cable lugs acc. to DIN 46 234 are connected, as of a conductor cross-section of 240 mm <sup>2</sup> and DIN 46 235 as of a conductor cross-section of 185 mm <sup>2</sup> , a 3RT19 66-4EA1 terminal cover is necessary to comply with the phase clearance.
	Stranded with cable lug	mm <sup>2</sup> 70 ... 240	
	AWG conductor connections, solid or stranded	2/0 ... 500 kcmil	
	Connecting bar (max. width)	mm 25	
	– Terminal screws	M 10 x 30 (A/F 17)	
	– Tightening torque	Nm 14 ... 24 (124 ... 210 lb.in)	
	<b>Auxiliary conductor:</b>		
	Solid	mm <sup>2</sup> 2 x (0.5 ... 1.5); 2 x (0.75 ... 2.5) acc. to IEC 60 947;	
		max. 2 x (0.75 ... 4)	
	Finely stranded with end sleeve	mm <sup>2</sup> 2 x (0.5 ... 1.5); 2 x (0.75 ... 2.5)	
	AWG conductor connections, solid or stranded	AWG 2 x (18 ... 14)	
	– Terminal screws	M 3 (PZ3)	
	– Tightening torque	Nm 0.8 ... 1.2 (7 ... 10.3 lb.in)

3TF68 and 3TF69 Vacuum contactors

**Overview**

**Standards**

IEC 60947-1, EN 60947-1,  
IEC 60947-4-1, EN 60947-4-1,  
IEC 60947-5-1, EN 60947-5-1 (auxiliary switches)

The 3TF68/69 contactors are climate-proof.

They are finger-safe according to EN 50274. Terminal covers may have to be fitted onto the connecting bars, depending on the configuration with other devices (see [Accessories and Spare Parts](#) on page 2/54).

**Main contacts**

Contact erosion indication with 3TF68/69 vacuum contactors

The contact erosion of the vacuum interrupters can be checked during operation with the help of 3 white double slides on the contactor base. If the distance indicated by one of the double slides is < 0.5 mm while the contactor is in the closed position, then the vacuum interrupter must be replaced. To ensure maximum reliability, it is recommended to replace all 3 vacuum interrupters simultaneously.

**Auxiliary contacts**

Contact reliability

These auxiliary contacts are particularly suitable for solid-state circuits with currents  $\geq 1$  mA at a voltage  $\geq 17$  V.

**Electromagnetic compatibility**

The 3TF68/69...**C** contactors for AC operation are fitted with an electronically controlled solenoid operating mechanism with a high interference immunity (for EMC values see page 3/115). The solenoid coil is connected to varistors for protection against overvoltages.

The 3TF68/69...**Q**.. contactors for AC operation are designed for operation in systems with AC control supply voltage which is subject to strong interference. The solenoid systems of these contactors are configured in the DC economy circuit with rectification. The rectifier bridge is connected to varistors for protection against overvoltages.

**Protection of the main current paths**

An integrated RC varistor connection for the main current paths dampens the switching overvoltage rises to safe values. This prevents multiple restricting. It can therefore be assumed that the motor winding cannot be damaged by switching overvoltages with steep voltage rises.

Note:

During operation in installations in which the emitted interference limits cannot be observed, e.g. when used for output contactors in converters, 3TF68/69...**Q** contactors without a main current path circuit are recommended.

**Technical specifications**

3TF68 and 3TF69 Vacuum contactors

Contactor

3TF68 and 3TF69

Contact endurance of the auxiliary contacts

The contact endurance for utilization category AC-12 or AC-15/AC-14 depends mainly on the breaking current. It is assumed that the operating mechanisms are switched randomly, i.e. not synchronized with the phase angle of the supply system.

The characteristic curves apply to 230 V AC.

Contact erosion indication with vacuum contactors

The contact erosion of the vacuum interrupters can be checked during operation with the help of 3 white double slides on the contactor base.

If the distance indicated by one of the double slides is < 0.5 mm while the contactor is in the closed position, the vacuum interrupter must be replaced. To ensure maximum reliability, it is recommended to replace all 3 vacuum interrupters.

Contact endurance of the main contacts

**Short-circuit protection**

**Main circuit**  
 Fuse links, gG operational class:  
 LV HRC, type 3NA; DIAZED, type 5SB; NEOZED, type 5SE according to IEC 60947-4-1/EN 60947-4-1

• Type of coordination "1"	A	1000	1250
• Type of coordination "2"	A	500	630
• Weld-free <sup>4)</sup>	A	400	500

**Auxiliary circuit**

• Short-circuit test with fuse links of gG operational class: LV HRC, type 3NA; DIAZED, type 5SB; NEOZED, type 5SE with $I_k = 1$ kA acc. to IEC 60947-5-1	A	10	
• Test with miniature circuit breaker up to 230 V with C characteristic: Short-circuit current $I_k = 400$ A acc. to IEC 60947-5-1	A	10	

<sup>1)</sup> To easily replace the laterally mounted auxiliary switches it is recommended to maintain a minimum distance of 30 mm between the contactors.  
<sup>2)</sup> If mounted at a 90° angle (conducting paths are horizontally above each other), the switching frequency is reduced by 80% compared with the normal values.  
<sup>3)</sup> See "Endurance of the auxiliary contacts", page 2/173.  
<sup>4)</sup> Test conditions according to IEC 60947-4-1.  
<sup>5)</sup> For ambient temperatures > 55°C, only 3TF6.33-Q.-Z A02 contactors (= without connection of the main current path circuits) can be used. Then derating is also possible with these contactors:  
 - AC-1:  $I_{th} = 782$  A, 644 operating cycles/h;  
 - AC-3: operating range 0.85-1.05 x Us, 460 operating cycles/hour, mechanical endurance 5 million operating cycles, lateral clearance 10 mm

3TC contactors

**Overview**

**3TC4 and 3TC5**

IEC 60947-1, EN 60947-1,  
IEC 60947-4-1, EN 60947-4-1

The contactors are finger-safe according to EN 50274. Terminal covers may have to be fitted onto the connecting bars, depending on the configuration with other devices.

The DC motor ratings given in the tables are applicable to the DC-3 and DC-5 utilization categories with two-pole switching of the load or with the two conducting paths of the contactor connected in series.

One contactor conducting path can switch full power up to 220 V. The ratings for higher voltages are available on request.

**3TC7**

IEC 60947-4-1, EN 60947-4-1.

The contactors are suitable for use in any climate. They are suitable for switching and controlling DC motors as well as all other DC circuits.

The solenoid excitation is configured for a particularly large operating range. It is between 0.7 or 0.8 to 1.2 x  $U_s$ .

3TC74 contactors can be used at up to 750 V/400 A and 50 Hz in AC-1 operation.

**Application**

The contactors are suitable for switching and controlling DC motors as well as all other DC circuits.

A version with an especially large coil operating range is available for operation in electrically driven vehicles and in switchgears with significant fluctuations in the actuating voltage

**Technical specifications**

Contactors	Type	3TC4 and 3TC7	3TC5

# Control Relays

## 3RH2 control relays – size S00

### Technical specifications

Contactor relays	Type	<b>3RH2</b>
	Size	<b>S00</b>

#### Permissible mounting positions

The contactor relays are designed for operation on a vertical mounting surface.

Upright mounting position

Special version required  
(3RH21 22-2K .40 coupling relays and contactor relays with extended operating range on request)

#### Positively-driven operation of contacts in contactor relays

##### 3RH2:

**Yes**, in the basic unit and the auxiliary switch block as well as between the basic unit and the front-mounted auxiliary switch block (removable) acc. to:

- ZH 1/457
- IEC 60947-5-1, Appendix L

##### 3RH22:

**Yes**, in the basic unit and the auxiliary switch block as well as between the basic unit and the snap-on auxiliary switch block (permanently mounted) acc. to:

- ZH 1/457
- IEC 60947-5-1, Appendix L

##### Note:

3RH29 11-.NF. solid-state compatible auxiliary switch blocks have no positively-driven contacts.

##### Explanations:

There is positively-driven operation if it is ensured that the NC and NO contacts cannot be closed at the same time.

##### ZH1/457

Safety Rules for Controls on Power-Operated Metalworking Presses.

##### IEC 60947-5-1, Appendix L

Low-Voltage Controlgear, Controls and Contact Blocks. Special requirements for positively-driven contacts

#### Contact reliability

Contact reliability at 17 V, 1 mA acc. to IEC 60947-5-4

Frequency of contact faults  $< 10^{-8}$  i.e.  $< 1$  fault per 100 million operating cycles

#### Contact endurance for AC-15/AC-14 and DC-13 utilization categories

The contact endurance is mainly dependent on the breaking current. It is assumed that the operating mechanisms are switched randomly, i.e. not synchronized with the phase angle of the supply system.

If magnetic circuits other than the contactor coil systems or solenoid valves are present, e.g. magnetic brakes, protective measures for the load circuits are necessary, e.g. in the form of RC elements and free-wheel diodes.

The characteristic curves apply to:

- 3RH21/3RH22 contactor relays
- 3RH24 latched contactor relays
- 3RH29 11 auxiliary switch blocks<sup>1)</sup>
- Auxiliary switch blocks for snapping onto the front, max. 4-pole and for mounting onto the side in size S00

##### Diagram legend:

$I_a$  = Breaking current  
 $I_e$  = Rated operational current

<sup>1)</sup>  $I_e$  = 6 A for AC-15/AC-14.

# Control Relays

## 3RH2 control relays – size S00

Type			3RH21	3RH22	3RH24
Size			<b>S00</b>	<b>S00</b>	<b>S00</b>
Dimensions (W x H x D) with screw terminals		mm	45 x 57.5 x 73	--	90 x 57.5 x 73
• With mounted auxiliary switch block		mm	45 x 57.5 x 116	45 x 57.5 x 116	--

General technical specifications					
<b>Mechanical endurance</b>					
• Basic units	Operating cycles		30 million		5 million
• Basic unit with snap-on auxiliary switch block	Operating cycles		10 million		
• Solid-state compatible auxiliary switch block	Operating cycles		5 million		
<b>Rated insulation voltage <math>U_i</math></b> (pollution degree 3)	V		690		
<b>Rated impulse withstand voltage <math>U_{imp}</math></b>	kV		6		
<b>Protective separation</b> between the coil and the contacts in the basic unit acc. to IEC 60947-1, Appendix N	V		400		
<b>Permissible ambient temperature</b>					
• During operation	°C		-25 ... +60		
• During storage	°C		-55 ... +80		
<b>Degree of protection</b> acc. to IEC 60947-1, Appendix C			IP20, coil assembly IP40		
<b>Touch protection</b> acc. to EN 50274			Finger-safe		
<b>Shock resistance</b>					
• Rectangular pulse	- AC operation	g/ms	7.3/5 and 4.7/10		
	- DC operation	g/ms	>10/5 and >5/10		
• Sine pulse	- AC operation	g/ms	11.4/5 and 7.3/10		
	- DC operation	g/ms	>15/5 and >8/10		
<b>Short-circuit protection</b>					
• Short-circuit test with fuse links of gG operational class: DIAZED, type 5SB; NEOZED, type 5SE with short-circuit current $I_k = 1$ kA acc. to IEC 60947-5-1	A		10		
• Test with miniature circuit breaker up to 230 V with C characteristic: Short-circuit current $I_k = 400$ A acc. to IEC 60947-5-1	A		6		
<b>Conductor cross-sections</b>					
<b>Auxiliary conductors and coil terminals</b> (1 or 2 conductors can be connected)			<b>Screw terminals</b>		
• Solid	mm <sup>2</sup>		2 x (0.5 ... 1.5) <sup>1)</sup> ; 2 x (0.75 ... 2.5) <sup>1)</sup> according to IEC 60947; max. 2 x (0.5 ... 4)		
• Finely stranded with end sleeve	mm <sup>2</sup>		2 x (0.5 ... 1.5) <sup>1)</sup> ; 2 x (0.75 ... 2.5) <sup>1)</sup>		
• AWG cables, solid or stranded	AWG		2 x (20 ... 16) <sup>1)</sup> ; 2 x (18 ... 14) <sup>1)</sup>		
• Terminal screw			M3 (for standard screwdriver size 2 or Pozidriv 2)		
- Tightening torque	Nm		0.8 ... 1.2 (7 ... 10.3 lb.in)		
<b>Auxiliary conductors and coil terminals</b> (1 or 2 conductors can be connected)			<b>Spring-type terminals</b>		
• Operating devices	mm		3.0 x 0.5; 3.5 x 0.5		
• Solid	mm <sup>2</sup>		2 x (0.5 ... 4)		
• Finely stranded with end sleeve	mm <sup>2</sup>		2 x (0.5 ... 2.5)		
• Finely stranded without end sleeve	mm <sup>2</sup>		2 x (0.5 ... 2.5)		
• AWG cables, solid or stranded	AWG		2 x (20 ... 12)		
<b>Auxiliary conductors for front and laterally mounted auxiliary switches</b>			<b>Ring terminal lug connection</b>		
• Operating devices	mm		3.0 x 0.5; 3.5 x 0.5		
• Solid	mm <sup>2</sup>		2 x (0.5 ... 2.5)		
• Finely stranded with end sleeve	mm <sup>2</sup>		2 x (0.5 ... 1.5)		
• Finely stranded without end sleeve	mm <sup>2</sup>		2 x (0.5 ... 2.5)		
• AWG cables, solid or stranded	AWG		2 x (20 ... 14)		
<b>Auxiliary conductor and coil terminals</b>			<b>Ring terminal lug connection</b>		
• Terminal screw	mm		M3, Pozidriv size 2		
• Operating devices	Nm		Ø 5 ... 6		
• Tightening torque	mm		0.8 ... 1.2		
• Usable ring terminal lugs	mm		$d_2 = \text{min. } 3.2$		
- DIN 46234 without insulation sleeve	mm		$d_3 = \text{max. } 7.5$		
- DIN 46225 without insulation sleeve					
- DIN 46237 with insulation sleeve					
- JIS C2805 Type R without insulation sleeve					
- JIS C2805 Type RAV with insulation sleeve					
- JIS C2805 Type RAP with insulation sleeve					

<sup>1)</sup> If two different conductor cross-sections are connected to one clamping point, both cross-sections must lie in one of the ranges specified.

**Note:**

Max. external diameter of the cable insulation: 3.6 mm.

Tool for opening the spring-type terminals  
see [Accessories, page 2/79](#).

An insulation stop must be used for conductor cross-sections ≤1 mm<sup>2</sup>, see [Accessories, page 2/79](#).

# Control Relays

## 3RH2 control relays – size S00

Contactor relays	Type	3RH2.
	Size	S00
<b>Control circuits</b>		
<b>Coil operating range</b>		
• AC operation	At 50 Hz	0.8 ... 1.1 x $U_s$
	At 60 Hz	0.85 ... 1.1 x $U_s$
• DC operation	At +50 °C	0.8 ... 1.1 x $U_s$
	At +60 °C	0.85 ... 1.1 x $U_s$
<b>Power consumption of the solenoid coils</b> (when coil is cold and 1.0 x $U_s$ )		
• AC operation, 50 Hz		
- Closing	VA/p.f.	37/0.8
- Closed	VA/p.f.	5.7/0.25
• AC operation, 60 Hz		
- Closing	VA/p.f.	33/0.75
- Closed	VA/p.f.	4.4/0.25
• DC operation (closing = closed)	W	4.0
<b>Permissible residual current of the electronics</b> (with 0 signal)		
• For AC operation <sup>1)</sup>		< 4 mA x (230 V/ $U_s$ )
• For DC operation		< 10 mA x (24 V/ $U_s$ )
<b>Operating times<sup>2)</sup></b>		
Total break time = OFF-delay + Arcing time		
Values apply with coil in cold state and at operating temperature for operating range		
<u>AC operation</u>		
• Closing		
- ON-delay of NO contact	With 0.8 ... 1.1 x $U_s$ ms	8 ... 33
	With 1.0 x $U_s$ ms	9 ... 22
	3RH24 minimum operating time ms	≥ 35
- OFF-delay of NC contact	With 0.8 ... 1.1 x $U_s$ ms	6 ... 25
	With 1.0 x $U_s$ ms	6.5 ... 19
• Opening		
- OFF-delay of NO contact	With 0.8 ... 1.1 x $U_s$ ms	4 ... 15
	With 1.0 x $U_s$ ms	4.5 ... 15
	3RH24 minimum operating time ms	≥ 30
- ON-delay of NC contact	With 0.8 ... 1.1 x $U_s$ ms	5 ... 15
	With 1.0 x $U_s$ ms	5 ... 15
<u>DC operation</u>		
• Closing		
- ON-delay of NO contact	With 0.8 ... 1.1 x $U_s$ ms	30 ... 100
	With 1.0 x $U_s$ ms	35 ... 50
	3RH24 minimum operating time ms	≥ 100
- OFF-delay of NC contact	With 0.8 ... 1.1 x $U_s$ ms	25 ... 90
	With 1.0 x $U_s$ ms	30 ... 45
• Opening		
- OFF-delay of NO contact	With 0.8 ... 1.1 x $U_s$ ms	7 ... 13
	With 1.0 x $U_s$ ms	7 ... 12
	3RH24 minimum operating time ms	≥ 30
- ON-delay of NC contact	With 0.8 ... 1.1 x $U_s$ ms	13 ... 19
	With 1.0 x $U_s$ ms	13 ... 18
• Arcing time		10 ... 15

Dependence of the switching frequency  $z'$  on the operational current  $I'$  and operational voltage  $U'$ :  
 $z' = z \cdot I_0 / I' \cdot (U_0 / U')^{1.5} \cdot 1/h$

1) The 3RT29 16-1GA00 additional load module is recommended for higher residual currents (see page 2/74).

2) The OFF-delay of the NO contact and the ON-delay of the NC contact are increased if the contactor coils are attenuated against voltage peaks (noise suppression diode 6 to 10 times; diode assembly 2 to 6 times, varistor +2 to 5 ms).

	220 V	A	1.2
	440 V	A	0.5
	600 V	A	0.26
<b>Switching frequency</b>			
<b>Switching frequency <math>z</math> in operating cycles/hour</b>			
• For rated operation	AC-12/DC-12	$h^{-1}$	1000
• For utilization category	AC-15/AC-14	$h^{-1}$	1000
	DC-13	$h^{-1}$	1000
• No-load switching frequency		$h^{-1}$	10000
Dependence of the switching frequency $z'$ on the operational current $I'$ and operational voltage $U'$ : $z' = z \cdot I_e/I' \cdot (U_e/U')^{1.5} \cdot 1/h$			
<b>Ⓢ and Ⓜ rated data</b>			
<b>Basic units and auxiliary switch blocks</b>			
• Rated control supply voltage	V AC	max. 600	
• Rated voltage	V AC	600	
• Switching capacity		A 600, Q 600	
• Uninterrupted current at 240 V AC	A	10	

# Control Relays

## SIRIUS 3RH21 coupling relays for switching auxiliary circuits, 4-pole

### Technical specifications

All technical specifications not mentioned in the table below are identical to those of the 3RH21 contactor relays (see page 5/6).

Contactor type	3RH21 ...HB40	3RH21 ...JB40	3RH21 ...KB40
Size	S00	S00	S00
<b>Control circuits</b>			
<b>Coil operating range</b>	0.7 ... 1.85 x U <sub>s</sub>		
<b>Power consumption of the solenoid coil</b> (for cold coil) Closing = Closed			
• At U <sub>s</sub> = 17 V	W	1.4	
• At U <sub>s</sub> = 24 V	W	2.8	
• At U <sub>s</sub> = 30 V	W	4.4	
<b>Permissible residual current</b> of the electronics for 0 signal	< 10 mA x (24 V/U <sub>s</sub> )		
<b>Overvoltage configuration of the solenoid coil</b>	No overvoltage damping 	With diode 	With suppressor diode 
<b>Operating times</b>			
• <b>Closing</b> at 17 V			
- ON-delay NO	ms	40 ... 130	
- OFF-delay NC	ms	30 ... 80	
• At 24 V			
- ON-delay NO	ms	35 ... 60	
- OFF-delay NC	ms	25 ... 40	
• At 30 V			
- ON-delay NO	ms	25 ... 50	
- OFF-delay NC	ms	15 ... 30	
• <b>Opening</b> at 17 ... 30 V			
- OFF-delay NO	ms	7 ... 20	38 ... 65
- ON-delay NC	ms	20 ... 30	55 ... 75
<b>Upright mounting position</b>	Request required		

Contactor type	3RH21 ...MB40-0KT0	3RH21 ...VB40	3RH21 ...WB40
Size	S00	S00	S00
<b>Control circuits</b>			
<b>Coil operating range</b>	0.85 ... 1.85 x U <sub>s</sub>		
<b>Power consumption of the solenoid coil</b> (for cold coil) Closing = Closed at U <sub>s</sub> = 24 V	W	1.6	
<b>Permissible residual current</b> of the electronics for 0 signal	< 8 mA x (24 V/U <sub>s</sub> )		
<b>Overvoltage configuration of the solenoid coil</b>	Diode, varistor or RC element, attachable 	Built-in diode 	Built-in suppressor diode 

<b>Control circuits</b>			
<b>Operating times</b>			
• Closing at 20.5 V			
- ON-delay NO	ms	30 ... 120	
- OFF-delay NC	ms	20 ... 110	
• At 24 V			
- ON-delay NO	ms	25 ... 90	
- OFF-delay NC	ms	15 ... 80	
• At 44 V			
- ON-delay NO	ms	15 ... 60	
- OFF-delay NC	ms	10 ... 50	
• Closing at 17 ... 30 V			
- OFF-delay NO	ms	5 ... 20	20 ... 80
- ON-delay NC	ms	10 ... 30	30 ... 90
<b>Upright mounting position</b>	Request required		

# 3RT Contactors

## 3RT2 and 3RH2 contactors and relays

### Terminal designations and identification numbers for auxiliary contacts

#### Terminal designations

The terminal designations are 2-digit, e.g. 13, 14, 21, 22:

- Tens digit: Sequence digit
  - Related terminals have the same sequence digit
- Units digit: Function digit
  - 1-2 for normally closed contacts (NC)
  - 3-4 for normally open contacts (NO)

#### Identification numbers

The identification number indicates the number and type of the auxiliary contacts, e.g. 40, 31, 22, 13:

- 1st digit: number of normally open contacts (NO)
- 2nd digit: number of normally closed contacts (NC)

Examples:

- 31 = 3 NO + 1 NC
- 40 = 4 NO

### Selection guide for mountable auxiliary switch blocks for power contactors and contactor relays

The auxiliary switch blocks of the 3RH29 series for mounting on the front and side can be used for power contactors as well as for contactor relays.

Where the columns and lines intersect (blue and green in the example) you will find the identification number for the combination of basic unit (column) and auxiliary switch block (line).

The possible combinations of basic unit and mounted auxiliary switch block can be found in the tables below.

Auxiliary contacts		Version		3-pole contactors			Order No.
				3RT20 1 S00	3RT20 1 S00	3RT20 2 S0	
NO	NC	10	01	11			
				2. 3. 4. 5.	5. 6. 7. 8.	3. 4. 5. 6.	
				According to EN 50012 <sup>1)</sup>			
Auxiliary switches without NO contact

1) RH29 auxiliaries are intended to be used only with 3RT2 or 3RH2 base devices.  
 3RH19 auxiliaries are intended to be used only with 3RT1 or 3RH1 base devices.

2) Not for 3RT12. vacuum contactors

# 3RT Contactors and 3RH2 Control Relays

Accessories for size S00 to S3

## Circuit diagrams

### Accessories for size S3 contactors and control relays

**Solid-state time-delay blocks**  
(see configuring aid on page 2/38)

**Sizes S2 to S12**  
**3RT19 16-2E.../2F.../2G... solid-state, time-delay auxiliary switch blocks**

(Integrated varistors not shown)

A2 can only be connected to N(L-) via the time-delay relay.  
x don't connect

- ① Time-delay block
- ② Contactor

A2 can be connected to N(L-) via either the contactor or the time-delay relay.  
- - - optional connection

Designation	Circuit diagram
3RA2811-.CW10 ON-delay	
3RA2812-.DW10 OFF-delay with auxiliary voltage	
3RA2813-.AW10 ON-delay, 1 CO contact	
3RA2813-.FW10 ON-delay, 1 NC contact/ 1 NO contact	

Designation	Circuit diagram
3RA2814-.AW10 OFF-delay, 1 CO contact	
3RA2814-.FW10 OFF-delay with auxiliary voltage, 1 NC contact/ 1 CO contact	
3RA2815-.AW10 OFF-delay without auxiliary voltage, 1 CO contact	
3RA2815-.FW10 OFF-delay without auxiliary voltage, 1 NC contact/ 1 NO contact	

3RT29 accessories are intended to be used only with 3RT2 or 3RH2 base devices.  
3RT19 auxiliaries are intended to be used only with 3RT1 or 3RH1 base devices.

# 3RA Contactor Assemblies

## 3RA23 contactor assemblies for reversing

### Circuit diagrams

#### Size S00 to S0 Main circuit

The 3RA2913-2AA. (S00) and 3RA2913-2AA (S0) installation kit contains wiring connectors for connecting the main conducting paths, the mechanical interlock and two connecting clips for the contactors.

#### Sizes S2 to S3 Main circuit

The 3RA19 3-2A installation kits contain, among other things, the wiring connectors on the top and bottom for connecting the main conducting paths.

#### Control circuit (sizes S00 and S0)

(terminal designations of contactors according to EN 50 012)

##### for momentary-contact operation

##### for maintained-contact operation

#### Control circuit

(terminal designations of contactors according to EN 50 005)

##### for momentary-contact operation

##### for maintained-contact operation

The 3RA19 24-2B mechanical interlock contains one NC contact for the NC contact interlock for each contactor

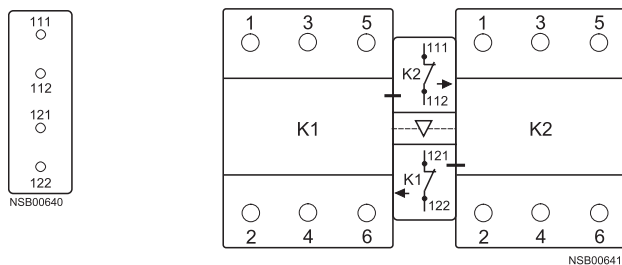

### Position of terminals

#### Sizes S2 to S3

#### Terminal designations according to EN 50 005

3RA19 24-2B mechanical interlock (laterally mountable), integrated in reversing contactor assemblies (reversing starters), contains one NC contact for the electrical interlock for each contactor

#### 2 NC

- S0 "OFF" button
- S1 "Clockwise ON" button
- S2 "Counterclockwise ON" button
- S "CW-OFF-CCW" button

- K1 Clockwise contactor
- K2 Counterclockwise contactor

- F1 Fuses for main circuit
- F3 Fuses for control circuit
- F2 Overload relay

# 3RA Contactor Assemblies

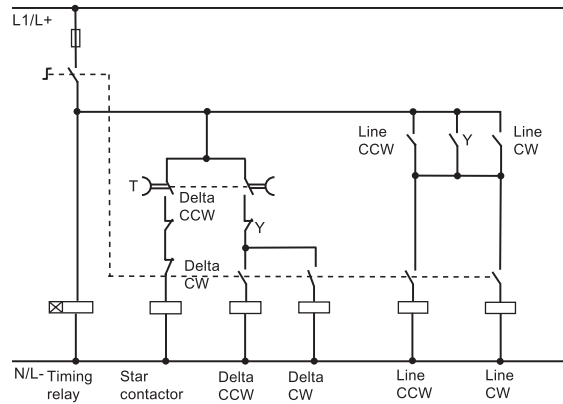

## Circuit Diagrams for WYE-delta switching

### Circuit diagrams

#### Size S00 / S0 Main circuit

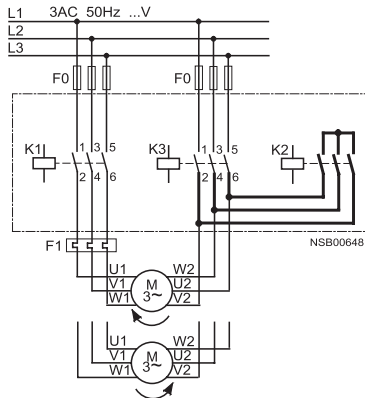

#### Control circuits with 3RA2816-0EW20 function module (set of three) snapped onto the front

#### Sizes S2 to S3 Main circuit

##### Sizes S2 and S3

#### 3RA2816-0EW20

#### Control circuits with 3RP15 7. time-delay relay, laterally mounted (typical circuits) for momentary-contact operation

#### for maintained-contact operation

Contact element 17/18 is only closed on the star step; the contact element is open on the delta step and when de-energized.

- S0 "OFF" button
- S1 "ON" button
- S Maintained-contact switch

- K1 Line contactor
- K2 Star contactor
- K3 Delta contactor
- K4 Solid-state, time-delay auxiliary switch block or time-delay relay
- F0 Fuses
- F1 Overload relay

# 3T Contactors

with 4-pole auxiliary switch block mounted on the front

The auxiliary switch block comprises 3 leading contacts (not shown) and one unassigned NO contact.

**Sizes S2 and S3**  
with 4-pole auxiliary switch block mounted on the front

The auxiliary switch block comprises 3 leading contacts (not shown) and one unassigned NO contact.

# 3RT1 Contactors

## 3RT1 contactors and accessories

**Position of terminals (applicable to screw connection and Spring-type terminal connection)**

**Sizes S6 to S12**

**3RT1.5, 3RT1.6, 3RT1.7 contactors**

- with conventional op. mechanism (3RT1...-A...)

with laterally mountable auxiliary switch blocks 3RH19 21-1DA11 (for 2 NO + 2 NC, incl. in contactor) 3RH19 21-1JA11 (expandable to 4 NO + 4 NC)

**2 NO + 2 NC or 4 NO + 4 NC**

- with solid-state op. mechanism (3RT1...-N...)

with laterally mountable auxiliary switch blocks 3RH19 21-1DA11 (for 2 NO + 2 NC, incl. in contactor) 3RH19 21-1JA11 (expandable to 4 NO + 4 NC)

**2 NO + 2 NC or 4 NO + 4 NC**

- with solid-state op. mechanism (3RT1...-P...)

with laterally mountable auxiliary switch blocks 3RH19 21-1DA11 (for 1 NO + 1 NC, incl. in contactor) 3RH19 21-1JA11 (expandable to 2 NO + 2 NC)

**1 NO + 1 NC or 2 NO + 2 NC**

**Contactors with 4 main contacts, size S00**  
Terminal designations acc. to EN 50 005

**3RT23 and 3RT25 contactors**

**4 NO**

**2 NO + 2 NC**

**Contactors with 4 main contacts, sizes S2 to S3**  
Terminal designations acc. to EN 50 005

**3RT13 and 3RT15 contactors**

**4 NO**

Size S0 with integrated 1NO + 1NC aux (13/14 + 21/22) and only one set of A1+A2 on front

**2 NO + 2 NC**

# 3T Contactors

## 3TF68 and 3TF69 vacuum contactors, 3-pole

### Position of terminals

#### AC operation

**3TF68 and 3TF69 contactors**  
4 NO + 4 NC

#### DC operation

**3TF68 and 3TF69 contactors**  
3 NO + 3 NC  
max. complement of auxiliary switches

#### Solid-state compatible auxiliary switch blocks

3TY7 561-1. for lateral mounting onto  
size 6 to 14 contactors

mounted  
on left

mounted  
on right

3RT20 contactors, 3-pole

Dimension drawings

**3RT2.1.-1 contactor and 3RH21.-1 contactor relays**  
 Size S00 and NEMA Size 0, screw connection  
 with surge suppressor and auxiliary switch block

Lateral clearance from earthed parts = 6 mm

- 1) Laterally mountable auxiliary switch block 3RH2911-1DA.. / -1DE.. / -1EE..
- 2) Auxiliary switch block for mounting on the front 3RH2911-1FA.. / -1GA.. / -1HA.. / -1NF..

**3RT2.1.-2 contactor and 3RH21.-2 contactor relay**  
 Size S00, Spring-type terminal connection  
 with auxiliary switch block

- 1) Laterally mountable auxiliary switch block 3RH2911-2DA.. / -2DE.. / -2EE..
- 2) Auxiliary switch block for mounting on the front 3RH2911-2FA.. / -2GA.. / -2HA.. / -2NF..

**3RT2.2.-1 contactors Size S0 and NEMA Size 1,**  
 (screw-type connection system) with auxiliary switch blocks mounted and other accessories

- 1) Laterally mountable auxiliary switch block 3RH2921-1DA.. / -1DE..
- 2) Auxiliary switch block for mounting on the front 3RH2911-1FA.. / -1GA.. / -1HA.. / -1NF..
- 3) 3-phase infeed terminal 3RV2925-5AB

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RT20 contactors, 3-pole

Dimension drawings

3RT2.2-2 and 3RT202-.....0LA2 contactors

Size S0 (spring-loaded connection) with auxiliary switch blocks mounted

For size S0:

- 1) Laterally mountable auxiliary switch block 3RH2921-2DA.. / -2DE..
- 2) Auxiliary switch block for mounting on the front 3RH2911-2FA.. / -2GA.. / -2HA.. / -2NF..

3RT20 3 contactors

Size S2 and NEMA Size 2, screw connection

with surge suppressor, auxiliary switch blocks and mounted overload relay

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

For size S2:

- a = 0 mm with varistor < 240 V, diode assembly
- a = 3.5 mm with varistor > 240 V
- a = 17 mm with RC element
- b = DC 15 mm deeper than AC

- 1) Auxiliary switch block, laterally mountable
- 2) Auxiliary switch block, mountable on the front (1, 2 and 4-pole)
- 3) Surge suppressor
- 4) Drilling pattern

3RT20 and 3RT24 contactors, 3-pole

Dimension drawings

3RT20 3 contactors

Size S2, Spring-type terminal connection with surge suppressor, auxiliary switch blocks and mounted overload relay

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

For size S2:

- a = 0 mm with varistor < 240 V, diode assembly
- a = 3.5 mm with varistor > 240 V
- a = 17 mm with RC element
- b = DC 15 mm deeper than AC

- 1) Auxiliary switch block, laterally mountable
- 2) Auxiliary switch block, mountable on the front (1, 2 and 4-pole)
- 3) Surge suppressor
- 4) Drilling pattern

3RT20 4, 3RT24 46 contactors

Size S3 and NEMA Size 3, screw connection with surge suppressor, auxiliary switch blocks and mounted overload relay

Lateral clearance from earthed parts = 6 mm

For size S3:

- a = 0 mm with varistor, diode assembly and < 240 V
- a = 3.5 mm with varistor and > 240 V
- a = 17 mm with RC element
- b = DC 13 mm deeper than AC

- 1) Auxiliary switch block, laterally mountable
- 2) Auxiliary switch block, mountable on the front (1, 2 and 4-pole), same dimensions for designs with screw or Spring-type connection
- 3) Surge suppressor
- 4) Drilling pattern
- 5) For mounting on 35 mm standard mounting rail (15 mm deep) acc. to EN 50 022 or 75 mm standard mounting rail acc. to EN 50 023
- 6) Hexagon socket screw 4 mm

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RT20 contactors, 3-pole

Dimension drawings

**3RT20 4 contactors,**  
**Size S3,** Spring-type terminal connection  
 with surge suppressor, auxiliary switch blocks  
 and mounted overload relay

CONTACTORS AND ASSEMBLIES 2

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RT10 and 3RT14 contactors, 3-pole

Dimension drawings

3RT10 5, 3RT14 5 contactors  
Size S6 and NEMA Size 4

with auxiliary switch block, laterally mountable and mountable on the front, mounted overload relay and box terminals, laterally mounted electronics module with remaining lifetime indication

Clearance from earthed parts with directly mounted overload relay:  
lateral: 10 mm  
front: 20 mm

For size S6:

k = 120 mm (minimum clearance for removing the withdrawable coil)

- 1) Second auxiliary switch block, laterally mountable
- 2) Auxiliary switch block, mountable on the front
- 3) RC element
- 4) 3RB10 overload relay, mounted
- 5) 3RT19 55-4G box terminal block (hexagon socket 4 mm)
- 6) 3RT19 56-4G box terminal block (hexagon socket 4 mm)
- 7) PLC connection DC 24 V and changeover switch (with 3RT1...-N)
- 8) Electronics module with remaining lifetime indication (auxiliary switch block not mountable on right-hand side)

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RT10 and 3RT14 contactors, 3-pole

Dimension drawings

3RT10 6, 3RT14 6 contactors  
Size S10

with auxiliary switch block, laterally mountable and mountable on the front,  
mounted overload relay and box terminals,  
laterally mounted electronics module with remaining lifetime indication

3RT10 7, 3RT14 7 contactors  
Size S12

with auxiliary switch block, laterally mountable and mountable on the front,  
mounted overload relay and box terminals,  
laterally mounted electronics module with remaining lifetime indication

For sizes S10 and S12:

Clearance from earthed parts with directly mounted  
overload relay:  
lateral: 10 mm  
front: 20 mm

For sizes S10 and S12:

k = 150 mm (minimum clearance for removing the  
withdrawable coil)

- 1) Second auxiliary switch block, laterally mountable
- 2) Auxiliary switch block, mountable on the front
- 3) RC element
- 4) 3RB10 overload relay, mounted
- 5) Box terminal block (hexagon socket 6 mm)
- 6) PLC connection DC 24 V and changeover switch (with 3RT1...-N)
- 7) Electronics module with remaining lifetime indication (auxiliary switch block not mountable on right-hand side)

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RT12 vacuum contactors, 3-pole

Dimension drawings

3RT12 6 vacuum contactors

Size S10

with auxiliary switch block, laterally mountable, mounted overload relay and box terminals, laterally mounted electronics module with remaining lifetime indication

Detail Contact erosion indicator for vacuum interrupters

3RT12 7 vacuum contactors

Size S12

with auxiliary switch block, laterally mountable, mounted overload relay and box terminals, laterally mounted electronics module with remaining lifetime indication

For sizes S10 and S12:

k = 150 mm (minimum clearance for removing the withdrawable coil)

- 1) Second auxiliary switch block, laterally mountable
- 2) Position and contact erosion indicator
- 3) RC element
- 4) 3RB10 overload relay, mounted
- 5) Box terminal block (hexagon socket 6 mm)
- 6) PLC connection DC 24 V and changeover switch (with 3RT1...-.N)
- 7) Electronics module with remaining lifetime indication (auxiliary switch block not mountable on right-hand side)

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RT23 and 3RT25 contactors, 4-pole

Dimension drawings

**3RT23 1 and 3RT25 1 contactors**

Size S00, screw connection with surge suppressor and auxiliary switch block

Lateral clearance from earthed parts = 6 mm

**For size S00:**

- 1) Laterally mountable auxiliary switch block 3RH2911-1DA.. / -1DE.. / -1EE..
- 2) Auxiliary switch block for mounting on the front 3RH2911-1FA.. / -1GA.. / -1HA.. / -1NF..

**3RT23 2 and 3RT25 2 contactors**

Size S0 with coil terminal module and auxiliary switch block

**For size S0:**

- 4) 4-pole contactor for switching 4 resistive loads 3RT232. 4-pole pole-changing contactor for changing the polarity of hoisting gear motors (2 NO contacts and 2 NC contacts) 3RT252.
- 5) Coil terminal module 3RT2926-4RA11/-4RB11
- 6) Auxiliary switch block for mounting on the front 3RH2911-1AA.. / -1BA

**3RT23 3 and 3RT25 3 contactors**

Size S2 with surge suppressor and auxiliary switch block

**For sizes S2 and S3:**

- a = 0 mm with varistor < 240 V
  - a = 3.5 mm with varistor > 240 V
  - a = 17 mm with RC element and diode assembly
  - b = S2: DC 15 mm deeper than AC
  - S3: DC 13 mm deeper than AC
- 1) Auxiliary switch block, laterally mountable (right or left)
  - 2) Auxiliary switch block, mountable on the front, (1, 2 and 4-pole, also 3RH19 21-1FE22 solid-state compatible design)
  - 3) Surge suppressor
  - 4) Drilling pattern
  - 5) For mounting on 35 mm standard mounting rail (15 mm deep) acc. to EN 50 022 or, in the case of size S3, 75mm standard mounting rail acc. to EN 50 023
  - 6) Hexagon socket screw 4 mm

**3RT23 4 contactors**

Size S3 with surge suppressor and auxiliary switch block

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RT16 capacitor contactors

Dimension drawings

3RT16 17 capacitor contactors  
Size S00

3RT16 27 capacitor contactors  
Size S0

3RT16 47 capacitor contactors  
Size S3

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RA23 contactor assemblies for reversing

Dimension drawings

Size S00 / 3RA231

Size S0 / 3RA232

Size S2 / 3RA233

Size S3 / 3RA234

For specific dimensions, 2D / 3D CAD files and technical data, please visit [www.siemens.com/cax](http://www.siemens.com/cax)

3RA13 contactor assemblies for reversing

Dimension drawings

Size S6

Size S10

The assemblies shown on this page are for customer assembly with individual components.

3RA13 contactor assemblies for reversing

Dimension drawings

Size S12

The assemblies shown on this page are for customer assembly with individual components.

3TF68 and 3TF69 vacuum contactors, 3TC4 and 3TC5 DC contactors

Dimension drawings

3TF68 vacuum contactors

Detail  
A = Contact erosion indicator for vacuum interrupter contacts

3TC4 and 3TC5 contactors

3TC44 contactors  
Size 2, AC and DC operation

t = minimum clearance from insulated components: 15 mm (600 V and 750 V)  
from grounded components: 30 mm (600 V and 750 V)

	a	b
DC operation	109	141
AC operation	68	100

3TF69 vacuum contactors

Detail  
A = Contact erosion indicator for vacuum interrupter contacts

3TC48 contactors  
Size 4, AC and DC operation

t = minimum clearance from insulated components: 15 mm (600 V), 20 mm (750 V)  
from grounded components: 35 mm (600 V), 55 mm (750 V)

	a	b	c
DC operation	112	180	21.5
AC operation	86	154	23.5

3TC52 contactors  
Size 8, AC and DC operation

t = minimum clearance from insulated components: 20 mm (600 V and 750 V)  
from grounded components: 70 mm (600 V and 750 V)

	a	b
DC operation	147	232
AC operation	115	200

1) With box terminals for laminated copper bars (accessories).

3TC56 contactors  
Size 12, AC and DC operation

t = minimum clearance from insulated components: 25 mm (600 V and 750 V)  
from grounded components: 80 mm (600 V), 100 mm (750 V)

	a	b
DC operation	200	310
AC operation	141	251

2) DC operation only

<sup>1)</sup> Motor currents up to 820 A can be recorded and evaluated by a current measuring module, e.g. 3RB29 06-2BG1 (0.3 to 3 A), in combination with 3UF18 68-3GA00 (820 A/1 A) series transformer.

<sup>2)</sup> The SIRIUS 3RN thermistor motor protection devices can be used to provide additional temperature-dependent protection.

<sup>1)</sup> "Technical Specifications" for use of the overload relays with trip class ≥ CLASS 20 can be found in "Short-circuit protection with fuses for motor feeders",

Connection methods

Depending on the device version of the 3RU2 and 3RB3 overload relays, the terminals for screw terminals, spring-type terminals or ring terminal lug connection are configured for both the main and auxiliary circuit in frame sizes S00 and S0.

The 3RU21 thermal overload relays come with screw terminals.

The electronic overload relays 3RB20 and 3RB21 are available with screw terminals (box terminals) or spring-type terminals on the auxiliary current side; the same applies for the evaluation modules of the 3RB22 to 3RB24 electronic overload relays for High-Feature applications.

# Thermal Overload Relays

3RU21 up to 100 A, CLASS 10

OVERLOAD RELAYS 3

## Description

The 3RU thermal overload relays up to 100 A are designed for current-dependent protection of applications with normal start-up conditions (see "Trip classes") against impermissibly high rises in temperature as a result of overload or phase failure (see "Phase failure protection"). An overload or phase failure causes the motor current to rise above the set rated motor current (see "Setting"). This current rise heats up the bimetal strips within the relay via heating elements which, in turn, operate the auxiliary contacts via a tripping mechanism due to their deflection (see "Auxiliary contacts"). These switch the load off via a contactor. The switch-off time is dependent on the ratio of tripping current to operational current  $I_e$  and is stored in the form of a tripping characteristic with long-term stability (see "Tripping characteristics"). The "Tripped" state is signalled by means of a switching position indicator (see "Indication of status").

Resetting takes place manually or automatically (see "Manual and automatic resetting") after a recovery time has elapsed (see "Recovery time").

The 3RU thermal overload relays are electrically and mechanically optimised to the 3RT contactors such that, in addition to individual mounting, they can also be directly mounted onto the contactors to save space (see "Design and mounting"). The main and auxiliary circuits can be connected in various ways (see "Connection"), including the use of Cage Clamp terminals. When the overload relay has been connected, it can be tested for correct functioning using a TEST slide (see "TEST function"). In addition to the TEST function, the 3RU thermal overload relay is equipped with a STOP function (see "STOP function").

For a wide variety of application possibilities for the 3RU thermal overload relay, please refer to the sections "Application", "Ambient conditions", "Overload relays in WYE-delta combinations" and "Operation with frequency converters".

The 3RU thermal overload relays can protect your loads from overload and phase failure. You must implement short-circuit protection (see "Short-circuit protection") by means of a fuse or circuit-breaker.

The 3RU thermal overload relays are environmentally friendly

(see "Environmental considerations") and comply with all the main international standards and approvals (see "Specifications" and "Increased safety type of protection EEx").

The accessories for the 3RU thermal overload relays have been designed on the principle that all requirements are covered by a small number of variants.

## Application

The 3RU thermal overload relays are designed for the protection of three-phase and single-phase AC and DC motors.

If single-phase AC or DC loads are to be protected using 3RU thermal overload relays, all three bimetal strips should be heated. Therefore all main circuits of the relay must be connected in series.

## Overload relays in WYE-delta combinations

When overload relays are used in WYE-delta combinations, it is important to note that only  $1/\sqrt{3}$  of the motor current flows through the mains contactor. An overload relay mounted on the main contactor must be set to 0.58 times the motor current.

A second overload relay must be mounted on the star contactor if your load is also to be optimally protected in WYE operation. The WYE current is  $1/3$  of the rated motor current. The relevant relay must be set to this current.

## Control circuit

An additional power supply is not required for operation of the 3RU thermal overload relays.

## Ambient conditions

The 3RU thermal overload relays are temperature compensating according to IEC 60 947-4-1/DIN VDE 0660 Part 102 in the temperature range  $-20\text{ }^{\circ}\text{C}$  to  $+60\text{ }^{\circ}\text{C}$ . For temperatures from  $+60\text{ }^{\circ}\text{C}$  to  $+80\text{ }^{\circ}\text{C}$ , the upper setting value of the setting range must be reduced by a specific factor as given in the table below.

Ambient temperature in $^{\circ}\text{C}$	Reduction factor for the upper setting value
+60	1.0
+65	0.94
+70	0.87
+75	0.81
+80	0.73

- 1 Connection for mounting onto contactors:**  
Optimally adapted in electrical, mechanical and design terms to the contactors. The overload relay can be connected directly to these contactor using these pins. Stand-alone installation is possible as an alternative (in conjunction with a terminal bracket for stand-alone installation).
- 2 Selector switch for manual/automatic RESET and RESET button:**  
With this switch you can choose between manual and automatic RESET. A device set to manual RESET can be reset locally by pressing the RESET button. A remote RESET is possible using the RESET modules (accessories), which are independent of size.
- 3 Switch position indicator and TEST function of the wiring:**  
Indicates a trip and enables the wiring test.
- 4 Motor current setting:**  
Setting the device to the rated motor current is easy with the large rotary knob.
- 5 STOP button:**  
If the STOP button is pressed, the NC contact is opened. This switches off the contactor downstream. The NC contact is closed again when the button is released.
- 6 Supply terminals:**  
Depending on the device version, the terminals for screw, spring-type or ring lug terminal connection are configured for the main and auxiliary circuit.

A sealable transparent cover can be optionally mounted (accessory). It secures the motor current setting against adjustment.

3RU21 26-4FB0 thermal overload relays

## Trip classes

The 3RU thermal overload relay is available for normal start-up conditions in CLASS 10. For further details about trip classes, see "Tripping characteristics".

## Tripping characteristics

The tripping characteristics show the relationship between the tripping time and the tripping current as a multiple of the operational current  $I_e$  and are specified for symmetrical three-pole and two-pole loading from cold.

The smallest current at which tripping occurs is called the limiting tripping current. In accordance with IEC 60 947-4-1/DIN VDE 0660 Part 102, this must lie within certain specified limits. The limits of the limiting tripping current lie, in the case of the 3RU11 thermal overload re-

lay for symmetrical three-pole loading between 105 % and 120 % of the operational current. Starting from the limiting tripping current, the tripping characteristic moves on to larger tripping currents based on the characteristics of the so-called trip classes (CLASS 10, CLASS 20 etc.). The trip classes describe time-intervals within which the overload relay must trip with 7.2 times the operational current  $I_e$  for symmetrical three-pole loading from cold.

The tripping times are:

CLASS	Tripping times
10A	2 s to 10 s
10	4 s to 10 s
20	6 s to 20 s
30	9 s to 30 s

## Description

This is the schematic representation of a characteristic. The characteristics of the individual 3RU thermal overload relays can be requested from Technical Assistance at the e-mail address: [nst.technical-assistance@siemens.de](mailto:nst.technical-assistance@siemens.de)

The tripping characteristic of a three-pole 3RU thermal overload relay (see characteristic for symmetrical three-pole loading from cold) is valid when all three bimetal strips are loaded with the same current simultaneously. If, however, only two bimetal strips are heated as a result of phase failure, these two strips would have to provide the force necessary for operating the release mechanism and, if no additional measures were implemented, they would require a longer tripping time or a higher current. These increased current levels over long periods usually result in damage to the consumer. To prevent damage, the 3RU thermal overload relay features phase failure sensitivity which, thanks to an appropriate mechanical mechanism, results in accelerated tripping according to the characteristic for two-pole loading from cold.

In contrast to a load in the cold state, a load at operating temperature has a lower heat reserve. This fact affects the 3RU thermal overload relay in that following an extended period of loading at operational current  $I_n$ , the tripping time reduces by about a quarter.

### Phase failure protection

The 3RU thermal overload relays feature phase failure protection (see "Tripping characteristics") for the purpose of minimizing the heating of the load during single-phase operation as a result of phase failure.

### Setting

The 3RU thermal overload relay is adjusted to the rated motor current using a rotary knob. The scale of the rotary knob is calibrated in Amperes.

### Manual and automatic resetting

It is possible to switch between manual resetting and automatic resetting by depressing and rotating the blue button (RESET button). When manual resetting is selected, a reset can be performed directly on the device by pressing the RESET button. Remote resetting can be implemented by using the mechanical and electrical RESET modules from the range of accessories (see "Accessories"). When the blue button is set to Automatic RESET, the relay will be reset automatically.

A reset is not possible until the recovery time has elapsed (see "Recovery time").

### Recovery time

After tripping due to an overload, it takes a certain length of time for the bimetal strips of the 3RU thermal overload relays to cool down. The relay can only be reset once it has cooled down. This time (recovery time) is dependent on the tripping characteristic and the level of the tripping current.

After tripping due to overload, the recovery time allows the load to cool down.

### TEST function

Correct functioning of the ready 3RU thermal overload relay can be tested with the TEST slide. The slide is operated to simulate tripping of the relay. During this simulation, the NC contact (95-96) is opened and the NO contact (97-98) is closed whereby the overload relay checks that the auxiliary circuit is wired correctly. When the 3RU thermal overload relay is set to Automatic RESET, an automatic reset takes place when the TEST slide is released. The relay must be reset using the RESET button when it is set to Manual RESET.

### STOP function

When the STOP button is pressed, the NC contact is opened and the series-connected contactor and therefore the load is switched Off. The load is reconnected via the contactor when the STOP button is released.

### Status indication

The current status of the 3RU thermal overload relay is indicated by the position of the marking on the "TEST function/switching position indicator" slide. The marking on the slide is on the left at the "O" mark following a trip due to overload or phase failure and at the "I" mark otherwise.

### Auxiliary contacts

The 3RU thermal overload relay is equipped with an NO contact for the tripped signal and an NC contact for switching off the contactor.

### Connection

All the 3RU thermal overload relays have screw terminals for the main and auxiliary circuits. Once the box terminals have been removed from the main conductor connections of the overload relays of size S3, it is possible to connect busbars.

Alternatively the devices are available with either spring loaded or with ring lug terminals on both the control and the main terminals. For details of various connection possibilities, see the "Technical data" and "Selection and ordering data".

### Design and mounting

The 3RU thermal overload relays are suitable for direct mounting on the 3RT contactors. They can also be mounted as single units if the appropriate adapters are used. For details of the mounting possibilities, see the "Selection and ordering data" and the "Technical data".

### Operation with frequency converters

The 3RU thermal overload relays are suitable for operation with frequency converters. Depending on the frequency of the converter, a current higher than the motor current may have to be set due to the occurrence of eddy currents and skin effects.

### Environmental considerations

The devices are manufactured taking environmental considerations into account and comprise environmentally-friendly and recyclable materials.

### Specifications

The 3RU thermal overload relays comply with the requirements of:

- IEC 60 947-1/ DIN VDE 0660 Part 100
- IEC 60 947-4-1/ DIN VDE 0660 Part 102
- IEC 60 947-5-1/ DIN VDE 0660 Part 200
- IEC 60801-2, -3, -4, -5 and
- UL 508/CSA C 22.2.

The 3RU11 thermal overload relays are also safe from touch according to DIN VDE 0106 Part 100 and climate-proof to IEC 721.

### Degree of protection "Increased safety" EEx

The 3RU thermal overload relay meets the requirements for overload protection of motors of the "Increased safety" type of protection EEx e IEC 50 019/ DIN VDE 0165, DIN VDE 0170, DIN VDE 171. KEMA test certificate number Ex-97.Y.3235, DMT 98 ATEX G001, EN 50 019: 1977 + A1 ... A5, Increased Safety "e". Appendix A, Guideline for temperature monitoring of squirrel cage motors during operation.

### Accessories

For the 3RU thermal overload relay, there are:

- one adapter for each of the four overload relay sizes S00 to S3 for individual mounting
- one electrical remote RESET module for all sizes in three different voltage variants
- one mechanical remote RESET module for all sizes
- one cable release for all sizes for resetting inaccessible devices
- terminal covers

The accessories can also be used for the 3RB solid state overload relay.

# Thermal Overload Relays

3RU21 up to 100 A, CLASS 10

### Selection and ordering data

**Features and technical characteristics**

- Auxiliary contacts: 1 NO + 1 NC
- Manual/automatic RESET
- Switching position indication
- CLASS 10
- TEST function
- STOP button
- Phase failure sensitivity
- Sealable cover: optional in S00, S0 & S2. Integrated in S3

- 1) Not available for size S0 3RU212 with current setting range below 14 A.
- 2) Size S00 and S0: main and auxiliary conductor terminals are spring-type.
- 3) Size S2 and S3 auxiliary terminals are spring-type only. Main conductor terminals are screw.
- 4) 3RU Overloads in S2 and S3 frame are available preassembled with a terminal bracket for standalone mounting. S2 and S3 overloads can also be customer assembled to the terminal bracket (see Accessories).
- 5) For overload relays > 100A, see electronic overload relays.

# 3RB2 / 3RB3 Solid-State Overload Relays

3RB20, 3RB21, 3RB30, 3RB31 up to 630A for standard applications

## Overview

- 1 Connection for mounting onto contactors:**  
Optimally adapted in electrical, mechanical and design terms to the contactors. The overload relay can be connected directly to these contactor using these pins. Stand-alone installation is possible as an alternative (in conjunction with a terminal bracket for stand-alone installation).
- 2 Selector switch for manual/automatic RESET and RESET button:**  
With this switch you can choose between manual and automatic RESET. A device set to manual RESET can be reset locally by pressing the RESET button. On the 3RB21 a solid-state remote is integrated into the unit.
- 3 Switch position indicator and TEST function of the wiring:**  
Indicates a trip and enables the wiring test.
- 4 Solid state test:**  
Enables a test of all important device components and functions.
- 5 Motor current setting:**  
Setting the device to the rated motor current is easy with the large rotary knob.
- 6 Trip class setting/internal ground-fault detection (3RB21 only):**  
Using the rotary switch you can set the required trip class and activate the internal ground-fault detection dependent on the starting conditions.
- 7 Connecting terminals (removable terminal block for auxiliary circuits):**  
The generously sized terminals permit connection of two conductors auxiliary circuit can be connected with screw-type terminals or with spring-loaded terminals.

The 3RB and 3RB solid-state overload relays up to 630 A with internal power supply have been designed for inverse-time delayed protection of loads with normal and heavy starting (see [Function](#)) against excessive temperature rise due to overload, phase unbalance or phase failure. An overload, phase unbalance or phase failure result in an increase of the motor current beyond the set motor rated current. This current rise is detected by the current transformers integrated into the devices and evaluated by corresponding solid-state circuits which then output a pulse to the auxiliary contacts. The auxiliary contacts then switch off the load by means of the contactors control circuit. The break time depends on the ratio between the tripping current and set current  $I_e$  and is stored in the form of a long-term stable tripping characteristic (see [Characteristic Curves](#)).

In addition to inverse-time delayed protection of loads against excessive temperature rise due to overload, phase unbalance and phase failure, the 3RB21/31 solid-state overload relays also allow internal ground-fault detection (not possible in conjunction with wye-delta assemblies). This provides protection of loads against high-resistance short-circuits due to damage to the insulation material, moisture, condensed water etc.

The "tripped" status is signaled by means of a switch position indicator (see [Function](#)). Resetting takes place either manually or automatically after the recovery time has elapsed (see [Function](#)).

The devices are manufactured in accordance with environmental guidelines and contain environmentally friendly and reusable materials. They comply with important worldwide standards and approvals.

## Application

### Industries

The 3RB2 / 3RB3 solid-state overload relays are suitable for customers from all industries who want to provide optimum inverse-time delayed protection of their electrical loads (e.g. motors) under normal and heavy starting conditions (CLASS 5 to CLASS 30), minimize project completion times, inventories and power consumption, and optimize plant availability and maintenance management.

### Application

The 3RB2 / 3RB3 solid-state overload relays have been designed for the protection of three-phase motors in sinusoidal 50/60 Hz voltage networks. The relays are not suitable for the protection of single-phase AC or DC loads.

The 3RU thermal overload relay or the 3RB22/3RB23 solid-state overload relay can be used for single-phase AC loads. For DC loads the 3RU thermal overload relays are available.

### Ambient conditions

The devices are insensitive to external influences such as shocks, corrosive environments, ageing and temperature changes.

For the temperature range from  $-25\text{ °C}$  to  $+60\text{ °C}$ , the 3RB2 / 3RB3 solid-state overload relays compensate the temperature according to IEC 60947-4-1.

The 3RB2 / 3RB3 solid-state overload relays are suitable for the overload protection of explosion-proof motors with "increased safety" type of protection EEx e according to ATEX guideline 94/9/EC. The relays meet the requirements of EN 60079-7 (Electrical apparatus for potentially explosive atmospheres – Increased safety "e").

The basic safety and health requirements of ATEX guideline 94/9/EG are fulfilled by compliance with

- EN 60947-1
- EN 60947-4-1
- EN 60947-5-1
- EN 60079-14

EU type test certificate for Group II, Category (2) G/D under application. It has the number PTB 09 ATEX 3001.

## Accessories

The following accessories are available for the 3RB2/3RB3 solid-state overload relays:

- One terminal bracket each for the overload relays size S00 and S0 (sizes S2 to S12 can be installed as single units without a terminal bracket)
- One mechanical remote RESET module for all sizes
- One cable release for resetting devices which are difficult to access (for all sizes)
- One sealable cover for all sizes
- Box terminals for sizes S6 and S10/S12
- Terminal covers for sizes S2 to S10/S12

# 3RB2 / 3RB3 Solid-State Overload Relays

3RB20, 3RB21, 3RB30, 3RB31 up to 630A for standard applications

## Design

### Device concept

The 3RB2 / 3RB3 solid-state overload relays are compact devices, i.e. current measurement (transformer) and the evaluation unit are integrated in a single enclosure.

### Mounting options

The 3RB2 / 3RB3 solid-state overload relays are suitable for direct and space-saving mounting onto 3RT1 / 3RT2 contactors and 3RW30/3RW31 soft starters as well as for stand-alone installation. For more information on the mounting options, please see [Technical Specifications and Selection and Ordering Data](#)

### Connection technique

#### Main circuit

All sizes of the 3RB2 / 3RB3 solid-state overload relays can be connected with screw-type terminals. As an alternative for sizes S3 to S10/S12, the main circuits can be connected via the Busbar. Sizes S2 to S6 of the 3RB20/3RB21 relays are also available with a straight-through transformer. In this case, the cables of the main circuit are routed directly through the feed-through openings of the relay to the contactor terminals.

#### Auxiliary circuit

Connection of the auxiliary circuit (removable terminal block) is possible with either screw terminals or spring-loaded terminals.

For more information on the connection options, see [Technical Specifications and Selection and Ordering Data](#).

### Overload relays in contactor assemblies for Wye-Delta starting

When overload relays are used in combination with contactor assemblies for Wye-Delta starting it must be noted that only 0.58 times the motor current flows through the line contactor. An overload relay mounted onto the line contactor must be set to 0.58 times the motor current.

When 3RB21 / 31 solid-state overload relays are used in combination with contactor assemblies for Wye-Delta starting, the internal ground-fault detection must not be activated.

### Operation with frequency converter

The 3RB2 / 3RB3 solid-state overload relays are suitable for frequencies of 50/60 Hz and the associated harmonics. This permits the 3RB2 / 3RB3 overload relays to be used on the incoming side of the frequency converter.

If motor protection is required on the outgoing side of the frequency converter, the 3RN thermistor motor protection devices or the 3RU thermal overload relays are available for this purpose.

# 3RB2 / 3RB3 Solid-State Overload Relays

3RB20, 3RB21, 3RB30, 3RB31 up to 630A for standard applications

## Function

### Basic functions

The 3RB2 / 3RB3 solid-state overload relays are designed for:

- Inverse-time delayed protection of loads from overloading
- Inverse-time delayed protection of loads from phase unbalance
- Inverse-time delayed protection of loads from phase failure
- Protection of loads from high-resistance short-circuits (internal ground-fault detection only with 3RB21 / 31).

### Control circuit

The 3RB2 / 3RB3 solid-state overload relays have an internal power supply, i.e. no additional supply voltage is required.

### Short-circuit protection

Fuses or motor starter protectors must be used for short-circuit protection. For assignments of the corresponding short-circuit protection devices to the 3RB2 / 3RB3 solid-state overload relays with/without contactor see [Technical Specifications and Selection and Ordering Data](#).

### Trip classes

The 3RB20 / 30 solid-state overload relays are available for normal starting conditions with trip CLASS 10 or for heavy starting conditions with trip CLASS 20 (fixed setting in each case).

The 3RB21 / 31 solid-state overload relays are suitable for normal and heavy starting. The required trip class (CLASS 5, 10, 20 or 30) can be adjusted by means of a rotary knob depending on the current starting condition.

For details of the trip classes see [Characteristic Curves](#).

### Phase failure protection

The 3RB2 / 3RB3 solid-state overload relays are fitted with phase failure protection (see [Characteristic Curves](#)) in order to minimize temperature rise of the load during single-phase operation.

Phase failure protection is not effective for loads with star-connection and a grounded neutral point or a neutral point which is connected to a neutral conductor.

### Setting

The 3RB2 / 3RB3 solid-state overload relays are set to the motor rated current by means of a rotary knob. The scale of the rotary knob is shown in amps.

With the 3RB21 / 31 solid-state overload relay it is also possible to select the trip class (CLASS 5, 10, 20 or 30) using a second rotary knob and to switch the internal ground-fault detection on and off.

### Manual and automatic reset

In the case of the 3RB2 / 3RB3 solid-state overload relays, a slide switch can be used to choose between automatic and manual resetting.

If manual reset is set, a reset can be carried out directly on the device after a trip by pressing the blue RESET button. Resetting is possible in combination with the mechanical reset options from the accessories range (see [Accessories](#)). As an alternative to the mechanical RESET options, the 3RB21 / 31 solid-state overload relays are equipped with an electrical remote RESET which may be utilized by applying a voltage of 24 V DC to the terminals A3 and A4.

If the slide switch is set to automatic RESET, the relay is reset automatically.

The time between tripping and resetting is determined by the recovery time.

### Recovery time

With the 3RB2 / 3RB3 solid-state overload relays the recovery time after inverse-time delayed tripping is between 0.5 and 3 minutes depending on the preloading when automatic RESET is set. These recovery times allow the load (e.g. motor) to cool down.

If the button is set to manual RESET, the 3RB2 / 3RB3 devices can be reset immediately after inverse-time delayed tripping.

After a ground fault trip the 3RB21 / 31 solid-state overload relays (with ground-fault detection activated) can be reset immediately without a recovery time regardless of the reset mode set.

### TEST function

With motor current flowing, the TEST button can be used to check whether the relay is working correctly (device/solid-state TEST). Current measurement, motor model and trip unit are tested. If these components are OK, the device is tripped in accordance with the table below. If there is an error, no tripping takes place.

Trip class	Required loading with the rated current prior to pressing the test button	Tripping within
CLASS 5	2 min	8 s
CLASS 10	4 min	15 s
CLASS 20	8 min	30 s
CLASS 30	12 min	45 s

Note: The test button must be kept pressed throughout the test.

Testing of the auxiliary contacts and the control current wiring is possible with the switch position indicator slide. Actuating the slide simulates tripping of the relay. During this simulation the NC contact (95-96) is opened and the NO contact (97-98) is closed. This tests whether the auxiliary circuit has been correctly wired.

After a test trip the relay is reset by pressing the RESET button.

### Self-monitoring

The 3RB2 / 3RB3 solid-state overload relays have a self-monitoring feature, i.e. the devices constantly monitor their own basic functions and trip if an internal fault is detected.

### Display of operating status

The respective operating status of the 3RB2 / 3RB3 solid-state overload relays is displayed by means of the position of the marking on the switch position indicator slide. After tripping due to overload, phase failure, phase unbalance or ground fault (ground fault detection possible only with 3RB21 / 31) the marking on the slide is to the left on the "O" mark, otherwise it is on the "I" mark.

### Auxiliary contacts

The 3RB2 / 3RB3 solid-state overload relays are fitted with an NO contact for the "tripped" signal, and an NC contact for switching off the contactor.

# 3RB2 / 3RB3 Solid-State Overload Relays

3RB20, 3RB21, 3RB30, 3RB31 up to 630A for standard applications

1) Please observe operational voltage.

2) Coordination and short-circuit equipment according to EN 60947-4-1:

**Type of coordination 1:** the contactor or starter must not endanger persons or the installation in the event of a short-circuit.

They do not need to be suitable for further operation without repair and the renewal of parts.

**Type of coordination 2:** the contactor or starter must not endanger persons or the installation in the event of a short-circuit.

They must be suitable for further operation. There is a risk of contact welding.

3) Contactor cannot be mounted.

4) Please ensure that the maximum AC-3 operational current has sufficient safety clearance from the rated current of the fuses.

### Characteristic curves

The tripping characteristics show the relationship between the tripping time and tripping current as multiples of the set current  $I_e$  and are given for symmetrical three-pole and two-pole loads from the cold state.

The smallest current used for tripping is called the minimum tripping current. According to IEC 60947-4-1, this current must be within specified limits. The limits of the total tripping current for the 3RB20/3RB21 solid-state overload relays for symmetrical three-pole loads are between 105 % and 120 % of the set current.

The tripping characteristic starts with the minimum tripping current and continues with higher tripping currents based on the characteristics of the so-called trip classes (CLASS 10, CLASS 20 etc.). The trip classes describe time intervals within which the overload relays have to trip with 7.2 times the set current  $I_e$  from the cold state for symmetrical three-pole loads.

The tripping times according to IEC 60947-4-1, tolerance band E, are as follows for:

Trip class	Tripping time
CLASS 5	3 ... 5 s
CLASS 10	5 ... 10 s
CLASS 20	10 ... 20 s
CLASS 30	20 ... 30 s

The tripping characteristic for a three-pole overload relay from the cold state (see illustration 1) only apply if all three phases are simultaneously loaded with the same current. In the event of a phase failure the 3RB20/3RB21 solid-state overload relays switch off the contactor more quickly in order to minimize heating of the load in accordance with the tripping characteristic for two-pole loads from the cold state (see illustration 2). With phase unbalance the devices switch off depending on the reason for the unbalance between the two characteristic curves.

Compared with a cold load, a load at operating temperature obviously has a lower temperature reserve. The tripping time of the 3RB2/3RB3 solid-state overload relays is reduced therefore to about 30 % when loaded with the set current  $I_e$  for an extended period.

Tripping characteristics for 3-pole loads

Illustration 1

Tripping characteristics for 2-pole loads

Illustration 2

The above illustrations are schematic representations of characteristic curves.

## Overview

3RB22/3RB23 evaluation module

- (1) Green "Ready" LED:  
A continuous green light signals that the device is working correctly.
- (2) Red "Ground Fault" LED:  
A continuous red light signals a ground fault.
- (3) Red "Thermistor" LED:  
A continuous red light signals an active thermistor trip.
- (4) Red "Overload" LED:  
A continuous red light signals an active overload trip; a flickering red light signals an imminent trip (overload warning).
- (5) Motor current and trip class adjustment:  
Setting the device to the motor current and to the required trip class dependent on the starting conditions is easy with the two rotary knobs.
- (6) Selector switch for manual/automatic RESET:  
With this switch you can choose between manual and automatic RESET.
- (7) Test/RESET button:  
Enables testing of all important device components and functions, plus resetting of the device after a trip when manual RESET is selected.
- (8) Connecting terminals (removable terminal block):  
The generously sized terminals permit connection of two conductors with different cross-sections for the auxiliary, control and sensor circuits. Connection is possible with screw-type terminals and alternatively with spring-loaded terminals.
- (9) 3RB29 85 function expansion module:  
Enables more functions to be added, e.g. internal ground fault detection and/or an analog output with corresponding signals.

3RB29 06 current measuring module

The modular, solid-state overload relays with external power supply type 3RB22 (with monostable auxiliary contacts) and type 3RB23 (with bistable auxiliary contacts) up to 630 A (up to 820 A possible with a series transformer) have been designed for inverse-time delayed protection of loads with normal and heavy starting (see [Function](#)) against excessive temperature rises due to overload, phase unbalance or phase failure. An overload, phase unbalance or phase failure result in an increase of the motor current beyond the set motor rated current. This current rise is detected by means of a current measuring module and electronically evaluated by a special evaluation module which is connected to it. The evaluation electronics sends a signal to the auxiliary contacts. The auxiliary contacts then switch off the load by means of the contactors control circuit. The break time depends on the ratio between the tripping current and set current  $I_{\text{e}}$  and is stored in the form of a long-term stable tripping characteristic (see [Characteristic Curves](#)). The "tripped" status is signaled by means of a continuous red "Overload" LED.

The LED indicates imminent tripping of the relay due to overload, phase unbalance or phase failure by flickering when the limit current has been violated. This warning can also be used as a signal through auxiliary contacts.

In addition to the described inverse-time delayed protection of loads against excessive temperature rise, the 3RB22/3RB23 solid-state overload relays also allow direct temperature monitoring of the motor windings (full motor protection) by failsafe connection of a PTC sensor circuit. With this temperature-dependent protection, the loads can be protected against overheating caused indirectly by reduced coolant flow, for example, which cannot be detected by means of the current alone. In the event of overheating, the devices signal the contactor to switch off, and thus the load, by means of the auxiliary contacts. The "tripped" status is signaled by means of a continuous red "Thermistor" LED.

To also protect the loads against high-resistance short-circuits due to damage to the insulation, humidity, condensed water, etc., the 3RB22/3RB23 solid-state overload relays offer the possibility of internal ground fault monitoring in conjunction with a function expansion module; not possible in conjunction with a contactor assembly for Wye-Delta starting). In the event of a ground fault the 3RB22/3RB23 relays trip instantaneously. The "tripped" status is signaled by means of a red "Ground Fault" LED. Signaling through auxiliary contacts is also possible.

After tripping due to overload, phase unbalance, phase failure, thermistor tripping or ground fault, the relay may be reset manually or automatically after the recovery time has elapsed (see [Function](#)).

In conjunction with a function expansion module the motor current measured by the microprocessor can be output in the form of an analog signal 4 ... 20 mA DC for operating rotary coil instruments or for feeding into analog inputs of programmable logic controllers. With an additional AS-Interface analog module the current values can also be transferred over the AS-i bus system.

The devices are manufactured in accordance with environmental guidelines and contain environmentally friendly and reusable materials.

They comply with important worldwide standards and approvals.

# 3RB2 Solid-State Overload Relays

3RB22, 3RB23 for high-feature applications

## Benefits

The most important features and benefits of the 3RB22/3RB23 solid-state overload relays are listed in the overview table (see [Overload Relays, General Data](#)).

## Application

### Industries

The 3RB22/3RB23 solid-state overload relays are suitable for customers from all industries who want to provide optimum inverse-time delayed and temperature-dependent protection of their electrical loads (e.g. motors) under normal and heavy starting conditions (CLASS 5 to CLASS 30), minimize project completion times, inventories and power consumption, and optimize plant availability and maintenance management.

### Application

The 3RB22/3RB23 solid-state overload relays have been designed for the protection of three-phase asynchronous and single-phase AC motors.

If single-phase AC motors are to be protected by the 3RB22/3RB23 solid-state overload relays, the main circuits of the current measuring modules must be series-connected.

### Ambient conditions

The devices are insensitive to external influences such as shocks, corrosive environments, ageing and temperature changes.

For the temperature range from  $-25\text{ °C}$  to  $+60\text{ °C}$ , the 3RB22/3RB23 solid-state overload relays compensate the temperature according to IEC 60947-4-1.

Configuration notes for use of the devices below  $-25\text{ °C}$  or above  $+60\text{ °C}$  on request.

## "Increased safety" type of protection EEx e according to ATEX guideline 94/9/EC

The 3RB22/3RB23 solid-state overload relays are suitable for the overload protection of explosion-proof motors with "increased safety" type of protection EEx e. The relays meet the requirements of EN 60079-7 (Electrical apparatus for potentially explosive atmospheres – Increased safety "e").

When using 3RB23 solid-state overload relays for the protection of EEx e motors, separate monitoring of the control supply voltage is recommended.

The basic safety and health requirements of ATEX guideline 94/9/EG are fulfilled by compliance with

- EN 60947-1
- EN 60947-4-1
- EN 60947-5-1
- EN 60079-14

EU type test certificate for Group II, Category (2) G/D under application. Number on request.

## Accessories

The following accessories are available for the 3RB22/3RB23 solid-state overload relays:

- A sealable cover for the evaluation module
- Box terminal blocks for the current measuring modules size S6 and S10/S12
- Terminal covers for the current measuring modules size S6 and S10/S12
- Push-in lugs for screw (panel) mounting the size S00 to S3 current measuring modules

# 3RB2 Solid-State Overload Relays

3RB22, 3RB23 for high-feature applications

**3RB22/3RB23 solid-state overload relays for full motor protection with screw connection or spring-loaded terminals for stand-alone installation, CLASS 5, 10, 20 and 30 adjustable**

Features and technical specifications:

- Overload protection, phase failure protection and unbalance protection
- External power supply 24 ... 240 V AC/DC
- Auxiliary contacts 2 NO +2 NC
- Manual and automatic RESET
- Electrical remote RESET integrated
- 4 LEDs for operating and status displays
- TEST function and self-monitoring
- Internal ground fault detection with function expansion module
- Screw connection or spring-loaded terminals for auxiliary, control and sensor circuits
- Input for PTC sensor circuit
- Analog output with function expansion module

Size Contactor	Version	Connection type	Order No.	Weight per PU approx. kg
----------------	---------	-----------------	-----------	--------------------------

Evaluation modules

- 1) The analog signal 4 ... 20 mA DC can be used for operating rotary coil instruments or for feeding into analog inputs of programmable logic controllers.
- 2) The following information on ground fault protection refers to sinusoidal residual currents at 50/60 Hz:
  - With a motor current of between 0.3 and 2 times the set current  $I_n$  the unit will trip at a ground fault current equal to 30% of the set current.
  - With a motor current of between 2 and 8 times the set current  $I_n$  the unit will trip at a ground fault current equal to 15% of the set current.
  - The trip delay amounts to between 0.5 and 1 second.

*Note: Analog input modules, e. g. SM 331, must be configured for 4-wire measuring transducers. In this case the analog input module must not supply current to the analog output of the 3RB22/ 3RB23 relay.*

## 3RB2 Solid-State Overload Relays

3RB22, 3RB23 for high-feature applications

**Design****Device concept**

The 3RB22/3RB23 solid-state overload relays are based on a modular device concept. Each device always comprises an evaluation module, which is independent of the motor current, and a current measuring module, which is dependent on the motor current. The two modules are electrically interconnected by a connection cable through the system interface.

The basic functionality of the evaluation module can be optionally expanded with corresponding function expansion modules. The function expansion modules are integrated in the evaluation module for this purpose through a simple plug connection.

**Mounting options****Current measuring modules**

The current measuring modules size S00/S0 and S2/S3 are designed for stand-alone installation. By contrast, the current measuring modules size S6 and S10/S12 are suitable for stand-alone installation or direct mounting.

**Evaluation modules**

The evaluation modules can be mounted either on the current measuring module (only sizes S00/S0 and S2/S3) or separately.

**Connection technique****Main circuit (current measuring module)**

For sizes S00/S0, S2/S3 and S6, the main circuit can also be connected by the straight-through transformer method. In this case, the cables of the main circuit are routed directly through the feed-through openings of the relay to the contactor terminals.

For sizes S6 and S10/S12, the main circuit can be connected with the help of the Busbar. In conjunction with the corresponding box terminals, screw terminals are also available.

**Auxiliary circuit (evaluation module)**

Connection of the auxiliary circuit (removable terminal block) is possible with either screw terminals or spring-loaded terminals.

**Overload relays in contactor assemblies for Wye-Delta starting**

When overload relays are used in combination with contactor assemblies for Wye-Delta starting it must be noted that only 0.58 times the motor current flows through the line contactor. An overload relay mounted onto the line contactor must be set to 0.58 times the motor current.

When 3RB22/3RB23 solid-state overload relays are used in combination with contactor assemblies for Wye-Delta starting, the function expansion modules for internal ground-fault detection must not be used.

**Operation with frequency converter**

The 3RB22/3RB23 solid-state overload relays are suitable for frequencies of 50/60 Hz and the associated harmonics. This permits the 3RB22/3RB23 overload relays to be used on the incoming side of the frequency converter.

If motor protection is required on the outgoing side of the frequency converter, the 3RN thermistor motor protection devices or the 3RU11 thermal overload relays are available for this purpose.

**Function****Basic functions**

The 3RB22/3RB23 solid-state overload relays are designed for:

- Inverse-time delayed protection of loads from overloading
- Inverse-time delayed protection of loads from phase unbalance
- Inverse-time delayed protection of loads from phase failure
- Temperature-dependent protection of loads by connecting a PTC sensor circuit
- Protection of loads from high-resistance short-circuits (internal ground-fault detection; detection of fault currents > 30 % of the set current  $I_e$ )
- Output of an overload warning
- Output of an analog signal 4 to 20 mA DC as image of the flowing motor current

The basic functions of the evaluation modules in conjunction with function expansion modules are listed in the following table:

Evaluation module	Function expansion module	Basic functions
3RB22 83-4AA1 3RB22 83-4AC1 3RB23 83-4AA1 3RB23 83-4AC1	None	Inverse-time delayed protection, temperature-dependent protection, electrical remote RESET, overload warning
	3RB29 85-2CA1	Inverse-time delayed protection, temperature-dependent protection, internal ground-fault detection, electrical remote RESET, overload warning
	3RB29 85-2CB1	Inverse-time delayed protection, temperature-dependent protection, internal ground-fault detection, electrical remote RESET, ground fault signal
	3RB29 85-2AA0	Inverse-time delayed protection, temperature-dependent protection, electrical remote RESET, overload warning, analog output
	3RB29 85-2AA1	Inverse-time delayed protection, temperature-dependent protection, internal ground-fault detection, electrical remote RESET, overload warning, analog output
	3RB29 85-2AB1	Inverse-time delayed protection, temperature-dependent protection, internal ground-fault detection, electrical remote RESET, ground fault signal, analog output

**Control circuit**

The 3RB22/3RB23 solid-state overload relays require an external power supply (24–240 V AC/DC), i.e. an additional supply voltage is necessary.

**Short-circuit protection**

Fuses or motor starter protectors must be used for short-circuit protection. For assignments of the corresponding short-circuit protection devices to the 3RB22/3RB23 solid-state overload relays with/without contactor see [Technical Specifications and Selection and Ordering Data](#).

**Trip classes**

The 3RB22/3RB23 solid-state overload relays are suitable for normal and heavy starting. The required trip class (CLASS 5, 10, 20 or 30) can be adjusted by means of a rotary knob depending on the current starting condition.

For details of the trip classes see [Characteristic Curves](#).

# 3RB2 Solid-State Overload Relays

## 3RB22, 3RB23 for high-feature applications

### Phase failure protection

The 3RB22/3RB23 solid-state overload relays are fitted with phase failure protection (see [Characteristic Curves](#)) in order to minimize temperature rises of the load during single-phase operation.

### Setting

The 3RB22/3RB23 solid-state overload relays are set to the motor rated current by means of two rotary knobs.

- The upper rotary knob (CLASS/ $I_{e\max}$ ) is divided into 4 ranges: 1 A, 10 A, 100 A and 1000 A. The zone must be selected which corresponds to the rated motor current and the current measuring module to be used with it. With the range selected the required trip class (CLASS 5, 10, 20 or 30) can be determined.
- The lower rotary knob with percent scale (10 % ... 100 %) is then used to set the rated motor current in percent of the range selected with the upper rotary button.

### Example

- Rating of induction motor = 45 kW (50 Hz, 400 V AC)
- Rated motor current = 80 A
- Required trip class = CLASS 20
- Selected transformer: 10 to 100 A

### Solution

- Step 1: Use the upper rotary knob (CLASS) to select the 100 A range
- Step 2: Within the 100 A range set the trip class CLASS 20
- Step 3: Set the lower rotary knob to 80 % (= 0.8) of 100 A  $\times$  0.8 = 80 A.

If the current which is set on the evaluation module does not correspond to the current range of the connected current transformer, an error will result.

### Manual and automatic reset

In the case of the 3RB22/3RB23 solid-state overload relays, a slide switch can be used to choose between automatic and manual resetting.

If manual reset is set, a reset can be carried out directly on the device after a trip by pressing the blue TEST/RESET button. A remote RESET can be carried out electrically by jumpering the terminals Y1 and Y2.

If the slide switch is set to automatic RESET, the relay is reset automatically.

The time between tripping and resetting is determined by the recovery time.

### Recovery time

With the 3RB22/3RB23 solid-state overload relays the recovery time after inverse-time delayed tripping is approx. 3 minutes regardless of the selected reset mode. The recovery time allows the load to cool down.

However, in the event of temperature-dependent tripping by means of a connected PTC thermistor sensor circuit, the device can only be manually or automatically reset once the winding temperature at the installation location of the PTC thermistor has fallen 5 Kelvin below its response temperature.

After a ground fault trip the 3RB22/3RB23 solid-state overload relay trips can be reset immediately without a recovery time.

### TEST function

The combined TEST/RESET button can be used to check whether the relay is working correctly. The test can be aborted at any time by letting go of the TEST/RESET button.

LEDs, the device configuration (this depends on which expansion module is plugged in) and the device hardware are tested while the button is kept pressed for 6 seconds. Simultaneously and for another 18 seconds a direct current proportional in size to the maximum phase of the main current is fed in at the terminals I(+) and I(-). By comparing the analog signal, which is to be measured, with the main current, the accuracy of the current measurement can be determined. In this case 4 mA corresponds to 0 % and 20 mA to 125 % of the set current. After 24 seconds the auxiliary contacts are switched and the feeder switch off as the result, bringing the test to an end.

After a test trip a faultless relay is reset by pressing the TEST/RESET button. If a hardware fault is detected, the device trips and cannot be reset.

### Self-monitoring

The 3RB22/3RB23 solid-state overload relays have a self-monitoring feature, i.e. the devices constantly monitor their own basic functions and trip if an internal fault is detected.

### Display of the operating status

The particular operating status of the 3RB22/3RB23 solid-state overload relays is displayed by means of four LEDs:

- Green "Ready" LED: A continuous green light signals that the overload relay is ready for operation. The 3RB22/3RB23 overload relays are not ready (LED "OFF") if there is no control supply voltage or if the function test was negative.
- Red "Ground fault" LED: A continuous red light signals a ground fault.
- Red "Thermistor" LED: A continuous red light signals a temperature-dependent trip.
- Red "Overload" LED: A continuous red light signals an inverse-time delayed trip; a flickering red light signals an imminent inverse-time delayed trip (overload warning).

### Auxiliary contacts

The 3RB22/3RB23 solid-state overload relays have two outputs, each with one NO contact and one NC contact. Their basic assignment/function may be influenced by function expansion modules.

The 3RB22 and 3RB23 differ with respect to the tripping characteristics of their auxiliary contacts – monostable or bistable:

The monostable 3RB22 solid-state overload relays will enter the "tripped" state if the control supply voltage fails (> 200 ms), and return to the original state they were in before the control supply voltage failed when the voltage returns. These devices are therefore especially suited for plants in which the control voltage is not strictly monitored.

The bistable 3RB23 overload relays do not change their "tripped" or "not tripped" status if the control voltage fails. The auxiliary contacts only switch over in the event of an overload and if the supply voltage is present. These devices are therefore especially suited for plants in which the control voltage is monitored separately.

### Response if the control supply voltage fails

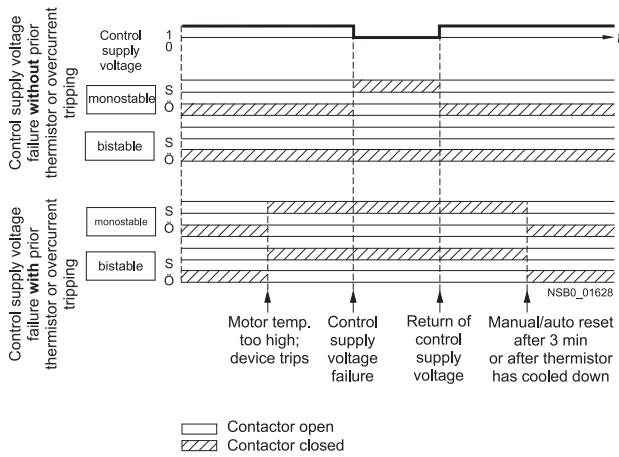

If the control supply voltage fails for more than 0.2 s, the output relays respond differently depending on the version: Monostable or bistable.

# 3RB2 Solid-State Overload Relays

3RB22, 3RB23 for high-feature applications

Response of the output relays in the event of	Monostable 3RB22	Bistable 3RB23
Failure of the control supply voltage	The device trips	No change of the switching status of the auxiliary contacts

- 1) Please observe operational voltage.
- 2) Coordination and short-circuit equipment according to EN 60947-4-1:
  - Type of coordination 1:** the contactor or starter must not endanger persons or the installation in the event of a short-circuit. They do not need to be suitable for further operation without repair and the renewal of parts.
  - Type of coordination 2:** the contactor or starter must not endanger persons or the installation in the event of a short-circuit. They must be suitable for further operation. There is a risk of contact welding.
- 3) Contactor cannot be mounted.
- 4) Please ensure that the maximum AC-3 operational current has sufficient safety clearance from the rated current of the fuses.

# 3RB2 Solid-State Overload Relays

3RB22, 3RB23 for standard applications

## Characteristic curves

The tripping characteristics show the relationship between the tripping time and tripping current as multiples of the set current  $I_e$  and are given for symmetrical three-pole and two-pole loads from the cold state.

The smallest current used for tripping is called the minimum tripping current. According to IEC 60947-4-1, this current must be within specified limits. The limits of the minimum tripping current for the 3RB22/3RB23 solid-state overload relays for symmetrical three-pole loads are between 105 % and 120 % of the set current.

The tripping characteristic starts with the minimum tripping current and continues with higher tripping currents based on the characteristics of the so-called trip classes (CLASS 10, CLASS 20 etc.). The trip classes describe time intervals within which the overload relays have to trip with 7.2 times the set current  $I_e$  from the cold state for symmetrical three-pole loads.

The tripping times according to IEC 60947-4-1, tolerance band E, are as follows for:

Trip class	Tripping time
CLASS 5	3 ... 5 s
CLASS 10	5 ... 10 s
CLASS 20	10 ... 20 s
CLASS 30	20 ... 30 s

The tripping characteristic for a three-pole overload relay from the cold state (see illustration 1) only apply if all three phases are simultaneously loaded with the same current. In the event of a phase failure or a current unbalance of more than 40 %, the 3RB22/3RB23 solid-state overload relays switch off the contactor more quickly in order to minimize heating of the load in accordance with the tripping characteristic for two-pole loads from the cold state (see illustration 2).

Compared with a cold load, a load at operating temperature obviously has a lower temperature reserve. The tripping time of the 3RB22/3RB23 solid-state overload relays are reduced therefore to about 30 % when loaded with the set current  $I_e$  for an extended period.

Tripping characteristics for 3-pole loads

Illustration 1

Tripping characteristics for 2-pole loads

Illustration 2

The above illustrations are schematic representations of characteristic curves. The characteristic curves of the individual 3RB22/3RB23 solid-state overload relays can be requested from Technical Assistance at the following e-mail address:

# 3RB2/3RB3 Solid-State Overload Relays

## Accessories

### Overview

#### Overload relays for standard applications

The following accessories are available for the 3RB2/3RB3 solid-state overload relays:

- One terminal bracket each for the overload relays size S00 and S0 (sizes S2 to S12 can be installed as single units without a terminal bracket)
- One mechanical RESET module for all sizes
- One cable release for resetting devices which are difficult to access (for all sizes)
- One sealable cover for all sizes
- Box terminal blocks for sizes S6 and S10/S12
- Terminal covers for sizes S2 to S10/S12

#### Overload relays for high-feature applications

The following accessories are available for the 3RB22/3RB23 solid-state overload relays:

- A sealable cover for the evaluation module
- Box terminal blocks for the current measuring modules size S6 and S10/S12
- Terminal covers for the current measuring modules size S6 and S10/S12
- Push-in lugs for screw mounting the size S00 to S3 current measuring modules

2) In the scope of supply for 3RT10 54-1 contactors (55 kW).

# 3RB2 Solid-State Overload Relays

## Accessories

### Overview

#### Overload relays for standard applications

The following accessories are available for the 3RB20/3RB21 solid-state overload relays:

- One terminal bracket each for the overload relays size S00 and S0 (sizes S2 to S12 can be installed as stand-alone installation without a terminal bracket)
- One mechanical remote RESET module for all sizes
- One cable release for resetting devices which are difficult to access (for all sizes)
- One sealable cover for all sizes
- Box terminal blocks for sizes S6 and S10/S12
- Terminal covers for sizes S2 to S10/S12

#### Overload relays for High-Feature applications

The following accessories are available for the 3RB22/3RB23 solid-state overload relays:

- A sealable cover for the evaluation module
- Box terminal blocks for the current measuring modules size S6 and S10/S12
- Terminal covers for the current measuring modules size S6 and S10/S12

## 3RB24 Solid-State Overload Relays

3RB24 for IO-Link, up to 630 A for High-Feature applications

## Overview

- 1 Green LED "DEVICE/IO-Link":  
A continuous green light signals that the device is working correctly, a green flickering light signals the communication through IO-Link.
- 2 Red LED "GND FAULT":  
A continuous red light signals an active ground-fault trip.
- 3 Red LED "THERMISTOR":  
A continuous red light signals an active thermistor trip.
- 4 Red LED "OVERLOAD":  
A continuous red light signals an active overload trip; a flickering red light signals an imminent trip (overload warning).
- 5 Motor current and trip class setting:  
Setting the device to the motor current and to the required trip class dependent on the start-up conditions is easy with the two rotary switches.
- 6 Selector switch for manual/automatic RESET:  
With this switch you can choose between manual and automatic RESET.
- 7 Test/RESET button:  
Enables testing of all important device components and functions, plus resetting of the device after a trip when manual RESET is selected.
- 8 Connecting terminals (removable terminal block):  
The generously sized terminals permit connection of two conductors with different cross-sections for the auxiliary, control and sensor circuits. Connection is possible with screw connection and alternatively with spring-type connection.
- 9 Plug-in point for operator panel:  
enables connection of the 3RA69 35-0A operator panel.

## SIRIUS 3RB24 evaluation module

The modular electronic overload relay 3RB24, which is powered via IO-Link (with monostable auxiliary contacts) up to 630 A (up to 820 A possible with a series transformer) have been designed for inverse-time delayed protection of loads with normal and heavy starting ("Function" see "Manual for SIRIUS 3RB24 Solid-State Overload Relay for IO-Link".) against excessive temperature rises due to overload, phase unbalance or phase failure. It comprises an evaluation unit, a current measuring module and a connecting cable. The evaluation module 3RB24 also offers an motor starter function: The contactors, which are connected via the auxiliary contacts, can also be actuated for operation via IO-Link. In this way, direct, reversing and star-delta starters up to 630 A (or 830 A) can be connected to the controller wirelessly via the IO-Link controller.

An overload, phase unbalance or phase failure result in an increase of the motor current beyond the set rated motor current.

This current rise is detected by means of the current measuring module (see page 3/55) and electronically evaluated by the evaluation module which is connected to it. The evaluation electronics sends a signal to the auxiliary contacts. The auxiliary contacts then switch off the load by means of a contactor. The

break time depends on the ratio between the tripping current and current setting  $I_e$  and is stored in the form of a long-term stable tripping characteristic (see [www.siemens.com/sirius/support](http://www.siemens.com/sirius/support) → "Characteristic Curves"). The "tripped" status is signaled by means of a continuously illuminated red "OVERLOAD" LED and also reported as a group fault via IO-Link.

The LED indicates imminent tripping of the relay due to overload, phase unbalance or phase failure by flickering when the limit current has been violated. This warning can also be reported to the higher-level PLC via IO-Link at the 3RB24 overload relay.

In addition to the described inverse-time delayed protection of loads against excessive temperature rises, the 3RB24 solid-state overload relays also allow direct temperature monitoring of the motor windings (full motor protection) by connection with broken-wire interlock of a PTC sensor circuit. With this temperature-dependent protection, the loads can be protected against overheating caused indirectly by reduced coolant flow, for example, which cannot be detected by means of the current alone. In the event of overheating, the devices switch off the contactor, and thus the load, by means of the auxiliary contacts. The "tripped" status is signaled by means of a continuously illuminated "THERMISTOR" LED and also reported as a group fault via IO-Link.

To the loads against incomplete ground faults due to damage to the insulation, humidity, condensation, etc., to protect the electronic overload relay 3RB24 offer the possibility of internal ground-fault detection (for details see "Manual for SIRIUS 3RB24 Solid-State Overload Relay for IO-Link", not possible in conjunction with contactor assembly for wye-delta starting). In the event of a ground fault, the 3RB24 relays trip instantaneously.

The "tripped" status is signaled by means of a flashing red LED "Ground Fault" and reported at the overload relay 3RB24 as a group fault via IO-Link.

The reset after overload, phase unbalance, phase failure, thermistor or ground-fault tripping is performed manually by key on site, via IO-Link or by electrical remote RESET or automatically after the cooling time (motor model) or for thermistor protection after sufficient cooling. Power cuts in devices due to function monitoring (broken wire or short circuit on the thermistor) can only be reset on-site ("Function" see "Manual for SIRIUS 3RB24 Solid-State Overload Relay for IO-Link"). In conjunction with a function expansion module, the motor current measured by the microprocessor can be output in the form of an analog signal DC 4 to 20 mA for operating rotary coil instruments or for feeding into analog inputs of programmable logic controllers.

The current values can be transmitted to the higher-level controller via IO-Link.

The devices are manufactured in accordance with environmental guidelines and contain environmentally friendly and reusable materials.

They comply with all important worldwide standards and approvals.

**Type of protection "increased safety EEx e and explosion-proof enclosure EEx d" in accordance with ATEX Directive 94/9/EC**

The electronic overload relay 3RB24 (monostable) are suitable for the overload protection of explosion-proof motors of types of protection EEx e and EEx d.

They comply with the requirements of EN 60079-7 (Electrical apparatus for areas subject to explosion hazards - Increased safety "e" as well as for flameproof enclosure "d"); see [www.siemens.com/sirius/atex](http://www.siemens.com/sirius/atex).

EC type test certificate for Group II, Category (2) G/D has been submitted. On request.

# 3RB24 Solid-State Overload Relays

3RB24 for IO-Link, up to 630 A for High-Feature applications

**Note:**

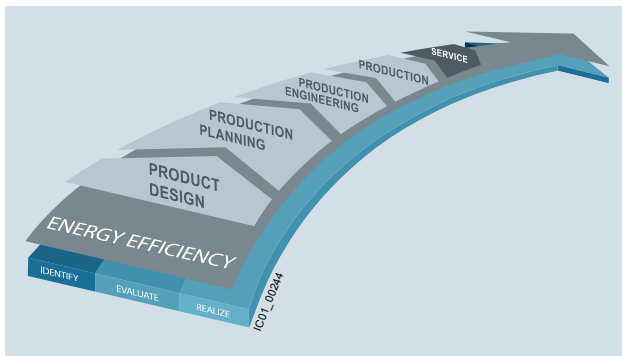

The Order No. scheme is presented here merely for information purposes and for better understanding of the logic behind the order numbers.

For your orders, please use the order numbers quoted in the catalog in the Selection and ordering data.

**Benefits**

The most important features and benefits of the 3RB24 solid-state overload relays for IO-Link are listed in the overview table (see "General Data", page 3/2 onwards).

**Advantages through energy efficiency**

Overview of the energy management process

We offer you a unique portfolio for industrial energy management, using an energy management system that helps to optimally define your energy needs. We split up our industrial energy management into three phases – Identification, Evaluation and Realization – and we support you with the appropriate hardware and software solutions in every process phase.

The innovative products of the SIRIUS industrial controls portfolio can also make a substantial contribution to a plant's energy efficiency (see [www.siemens.com/sirius/energysaving](http://www.siemens.com/sirius/energysaving)).

3RB24 solid-state overload relays for IO-Link contribute to energy efficiency throughout the plant as follows:

- Transmission of current values
- Reduced inherent power loss
- Less heating of the control cabinet
- Smaller control cabinet air conditioners can be used

**Application**

**Industries**

The 3RB24 solid-state overload relays are suitable for customers from all industries who want to guarantee optimum inverse-time delayed and temperature-dependent protection of their electrical loads (e.g. motors) under normal and heavy starting conditions (CLASS 5 to 30), minimize project completion times, inventories and energy consumption, and optimize plant availability and maintenance management.

**Application**

The 3RB24 solid-state overload relays have been designed for the protection of three-phase asynchronous and single-phase AC motors.

In addition to protection function, these devices can be used together with contactors as direct or reversing starters (star-delta (wye-delta) start also possible), which are controlled via IO-Link. This makes it possible to directly control drives via IO-Link from a higher-level controller or on site via the optional hand-held device lamps and also, for example, to return current values directly via IO-Link.

If single-phase AC motors are to be protected by the 3RB24 solid-state overload relays, the main current paths of the current measuring modules must be series-connected ("Schematics" see "Manual for SIRIUS 3RB24 Solid-State Overload Relay for IO-Link",).

**Ambient conditions**

The devices are insensitive to external influences such as shocks, corrosive ambient conditions, ageing and temperature fluctuations.

For the temperature range from -25 °C to +60 °C, the 3RB24 solid-state overload relays compensate the temperature in accordance with IEC 60947-4-1.

Configuration notes for use of the devices below -25 °C or above +60 °C on request.

## Accessories for 3RB22, 3RB23, 3RB24

### Overview

#### Overload relays for High-Feature applications

The following optional accessories are available for the 3RB22 to 3RB24 solid-state overload relays:

- Operator panel for the evaluation modules 3RB24
- Manual 3RB24
- Sealable cover for the evaluation modules 3RB22 to 3RB24
- Terminal covers for the 3RB29 current measuring modules sizes S6 and S10/S12
- Box terminal blocks for the 3RB29 current measuring modules sizes S6 and S10/S12
- Push-in lugs for screw fixing for 3RB22 to 3RB24 evaluation modules and 3RB29 06 current measuring modules

• Finely stranded with end sleeve	mm <sup>2</sup>	$2 \times (0.25 \dots 1.5)$
• Stranded	mm <sup>2</sup>	$2 \times (0.25 \dots 1.5)$
• AWG cables, solid or stranded	AWG	$2 \times (24 \dots 16)$

1) Analog input modules, e.g. SM 331, must be configured for 4-wire measuring transducers. The analog input module may not supply current to the analog output of the 3RB24 overload relay.

2) If two different conductor cross-sections are connected to one clamping point, both cross-sections must be in the range specified.

# 3RB24 Solid-State Overload Relays

Current measuring modules for 3RB22, 3RB23, 3RB24

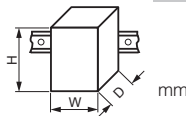

## Overview

SIRIUS 3RB29 06 current measuring module

The current measuring modules are designed as system components for connecting to evaluation units 3RB22 to 3RB24. Using these evaluation units the motor current is measured and the measured value sent to the evaluation unit for evaluation. The current measuring modules in sizes S00 to S3 up to 55 mm wide are equipped with straight-through transformers and can be snap-fitted under the evaluation units. The larger evaluation units are installed directly on the contactor or as stand-alone units.

---------------------	----	-----	----	----	---

<sup>1)</sup> When connecting cable lugs according to DIN 46235 with conductor cross-sections of 95 mm<sup>2</sup> and more, the 3RT19 56-4EA1 terminal cover must be used to ensure phase spacing.

<sup>2)</sup> When connecting cable lugs according to DIN 46234 with conductor cross-sections of 240 mm<sup>2</sup> and more as well as to DIN 46235 with conductor cross-sections of 185 mm<sup>2</sup> and more, the 3RT19 56-4EA1 terminal cover must be used for to keep the phase clearance.

3 OVERLOAD RELAYS

## SIMOCODE pro 3UF7

## General data

## Overview

SIMOCODE pro S for efficient entry into motor management and SIMOCODE pro V for maximum functionality

**More information**

Home page, see [www.usa.siemens.com/simocode](http://www.usa.siemens.com/simocode)

Industry Mall, see [www.siemens.com/product?3UF7](http://www.siemens.com/product?3UF7)

SIMOCODE pro is a flexible, modular motor management system for motors with constant speeds in the low-voltage performance range. It optimizes the connection between I&C and motor feeder, increases plant availability and allows significant savings to be made for installation, commissioning, operation and maintenance of a system.

SIMOCODE pro offers, for example:

- Multifunctional, solid-state full motor protection that is independent of the automation system
- Integrated control functions instead of hardware for the motor control
- Detailed operational, service and diagnostics data
- Open communication via PROFIBUS DP, PROFINET/OPC UA, Modbus RTU or EtherNet/IP
- Safety relay function for the fail-safe disconnection of motors up to SIL 3 (IEC 61508, IEC 62061) or PL e with Category 4 (EN ISO 13849-1)
- SIMOCODE ES is the software package for SIMOCODE pro parameterization, start up and diagnostics.

**Device series**SIMOCODE pro C

The compact system for direct-on-line starters and reversing starters or for controlling a motor starter protector.

SIMOCODE pro S

The smart system for direct-on-line, reversing, and wye-delta starters or for controlling a motor starter protector or soft starter. Its expandability with a multifunction module provides comprehensive input/output project data volume, precise ground-fault detection via the 3UL23 residual-current transformers and temperature measurement.

SIMOCODE pro V

The variable system with all control functions and with the possibility of expanding the inputs, outputs and functions of the system at will using expansion modules

✓ Available

-- Not available

<sup>1)</sup> Maximum of five expansion modules.

<sup>2)</sup> When an operator panel with display and/or a decoupling module are used, more restrictions on the number of expansion modules connectable per basic unit must be observed, see page 3/72.

<sup>3)</sup> The fail-safe digital module can be used instead of one of the two digital modules.

Per feeder each system always comprises one basic unit and one separate current measuring module. The two modules are connected together electrically through the system interface with a connection cable and can be mounted mechanically connected as a unit (one behind the other) or separately (side by side). The motor current to be monitored is decisive only for the choice of the current measuring module.

An operator panel for mounting in the control cabinet door is optionally connectable through a second system interface on the basic unit. Both the current measuring module and the operator panel are electrically supplied by the basic unit through the connection cable. More inputs, outputs and functions can be added to the SIMOCODE pro V and SIMOCODE pro S by means of optional expansion modules, thus supplementing the inputs and outputs already existing on the basic unit. With the DM-F Local and DM-F PROFIsafe fail-safe digital modules it is also possible to integrate the fail-safe disconnection of motors in the SIMOCODE pro V motor management system.

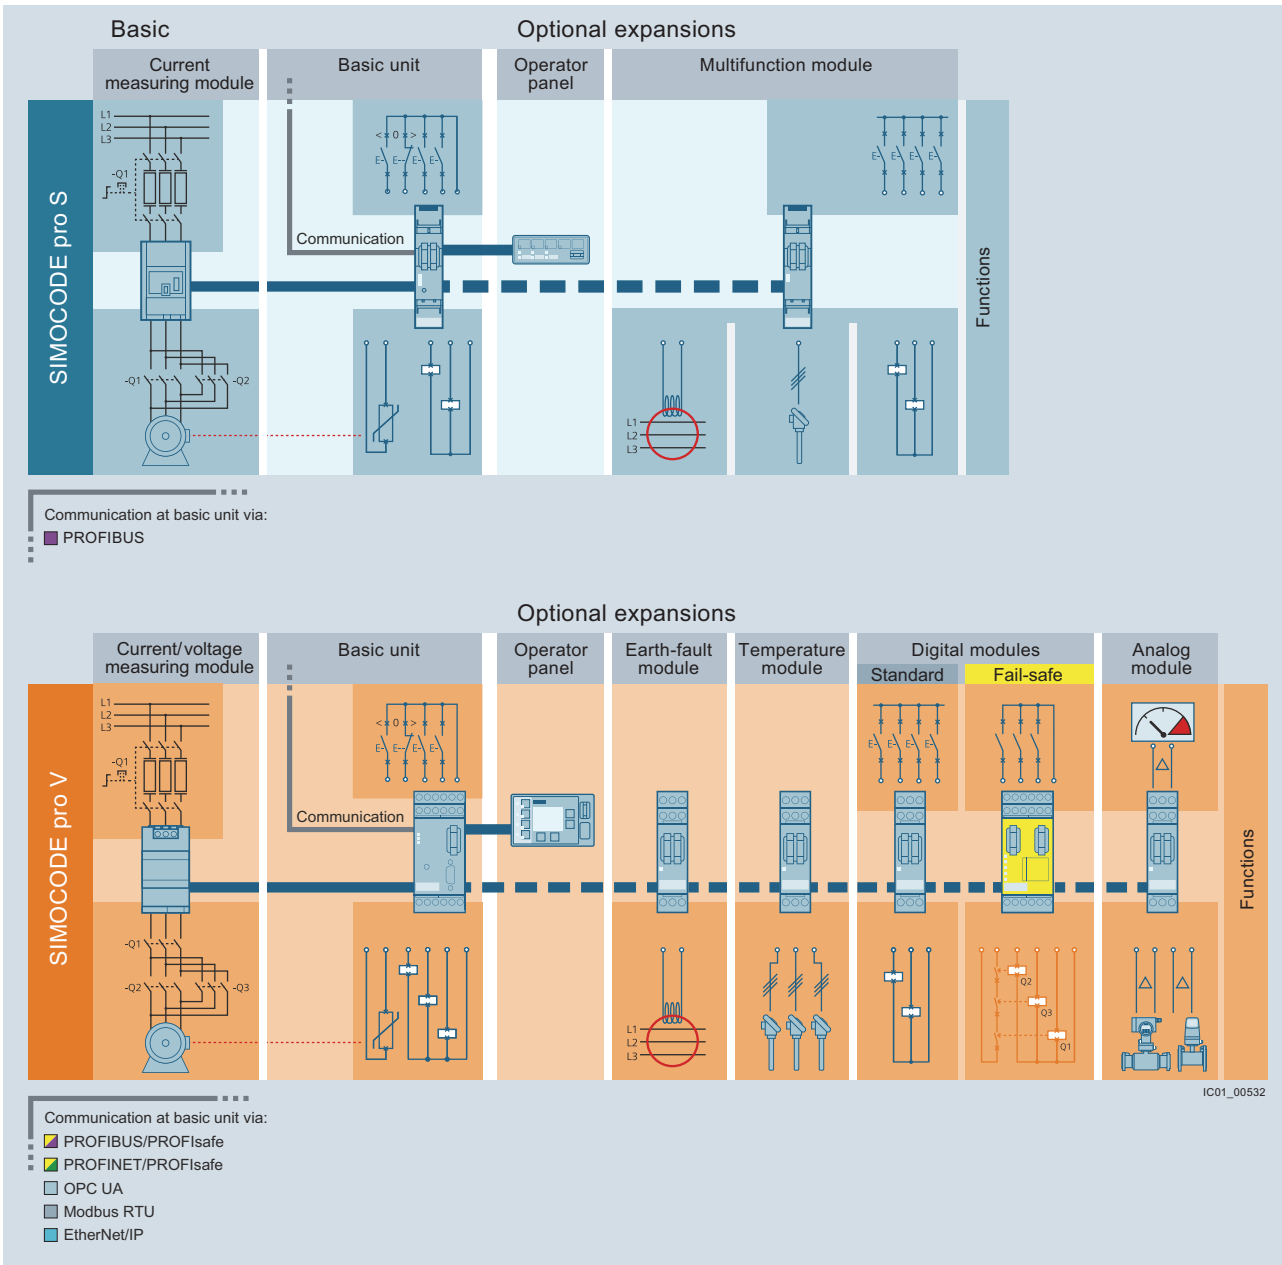

All modules are connected by connection cables. The connection cables are available in various lengths. The maximum distance between the modules (e.g. between the basic unit and the current measuring module) must not exceed 2.5 m. The total length of all the connection cables per system interface of the basic unit may be up to 3 m.

**Note:**

SIMOCODE pro can also be found in the TIA Selection Tool. The various system components can therefore be conveniently selected; see [www.siemens.com/tia-selection-tool](http://www.siemens.com/tia-selection-tool).

## SIMOCODE pro 3UF7

## General data

## Benefits

**General customer benefits**

- Integrating the whole motor feeder into the process control by means of PROFIBUS DP, PROFINET/OPC UA, Modbus RTU or EtherNet/IP significantly reduces the wiring between the motor feeder and the PLC.
- Decentralization of the automated processes by means of configurable control and monitoring functions in the feeder saves resources in the automation system and ensures full functionality and protection of the feeder even if the I&C or bus system fails
- The acquisition and monitoring of operating, service and diagnostics data in the feeder and process control system increases plant availability as well as maintenance and service-friendliness
- The high degree of modularity allows users to perfectly implement their plant-specific requirements for each motor feeder
- The SIMOCODE pro system offers functionally graded and space-saving solutions for each customer application
- The replacement of the control circuit hardware with integrated control functions decreases the number of hardware components and wiring required and in this way limits stock keeping costs and potential wiring errors
- The use of electronic full motor protection permits better utilization of the motors and ensures long-term stability of the tripping characteristic and reliable tripping even after years of service
- Thanks to the precision of the current, voltage, power and energy measurements (especially those acquired by the 2nd-generation current/voltage measuring modules), costs can be internally allocated with a high degree of accuracy.
- By virtue of its wide frequency range of 20 to 400 Hz, SIMOCODE can be used in combination with the 2nd-generation current/voltage measuring modules in a wide range of motor applications.

**Multifunctional, electronic full motor protection for rated motor currents up to 820 A**

SIMOCODE pro offers comprehensive protection of the motor feeder by means of a combination of different, multi-step and delayable protection and monitoring functions:

- Inverse-time delayed electronic overload protection (CLASS 5E to 40E)
- Thermistor motor protection
- Phase failure / unbalance protection
- Stall protection
- Monitoring of adjustable limit values for the motor current
- Voltage and power monitoring
- Monitoring of the power factor (motor idling/load shedding)
- Ground-fault monitoring
- Temperature monitoring, e.g. over PT100/PT1000
- Monitoring of operating hours, downtime and number of starts etc.

**Recording of measuring curves**

SIMOCODE pro can record measuring curves and therefore is able, for example, to present the progression of motor current during motor start up.

**Flexible motor control implemented with integrated control functions (instead of comprehensive hardware interlocks)**

Many predefined motor control functions have already been integrated into SIMOCODE pro, including all necessary logic operations and interlocks:

- Overload relays
- Direct-on-line and reversing starters
- Wye/delta starters (also with direction reversal)
- Two speeds, motors with separate windings (pole-changing starter); also with direction reversal
- Two speeds, motors with separate Dahlander windings (also with direction reversal)
- Positioner actuation
- Solenoid valve actuation
- Actuation of a motor starter protector
- Soft starter actuation (also with direction reversal)

These control functions are predefined in SIMOCODE pro and can be freely assigned to the inputs and outputs of the device (including the PROFIBUS/PROFINET process image).

These predefined control functions can also be flexibly adapted to each customized configuration of a motor feeder by means of freely configurable logic modules (truth tables, counters, timers, edge evaluation, etc.) and with the help of standard functions (power failure monitoring, emergency start, external faults, etc.), without additional auxiliary relays being necessary in the control circuit.

SIMOCODE pro makes a lot of additional hardware and wiring in the control circuit unnecessary, which results in a high level of standardization of the motor feeder in terms of its design and circuit diagrams.

## SIMOCODE pro 3UF7

## General data

**Detailed operational, service and diagnostics data**

SIMOCODE pro makes different operational, service and diagnostics data available and helps to detect potential faults in time and to prevent them by means of preventative measures. In the event of a malfunction, a fault can be diagnosed, localized and rectified very quickly - there are no or very short downtimes.

Operating data

- Motor switching state derived from the current flow in the main circuit
- All phase currents
- All phase voltages and phase-to-phase voltages
- Active power, apparent power and power factor
- Phase unbalance and phase sequence
- Ground-fault current
- Frequency
- Time to trip
- Motor temperature
- Remaining cooling time etc.

Service data

- Motor operating hours
- Motor stop times
- Number of motor starts
- Number of overload trips
- Interval for compulsory testing of the enabling circuits
- Energy consumed
- Internal comments stored in the device etc.

Diagnostics data

- Numerous detailed early warning and fault messages
- Internal device fault logging with time stamp
- Time stamping of freely selectable status, alarm or fault messages etc.

**Easy operation and diagnostics**Operator panel

The operator panel is used to control the motor feeder and can replace all conventional pushbuttons and indicator lights to save space. It makes SIMOCODE pro or the feeder directly operable in the control cabinet. It features all the status LEDs available on the basic unit and externalizes the system interface for simple parameterization or diagnosis on a PC/PG.

Operator panel with display

As an alternative to the 3UF720 standard operator panel for SIMOCODE pro V, a 3UF721 operator panel with display is also available. This can additionally indicate current measured values, operational and diagnostics data or status information of the motor feeder at the control cabinet. The pushbuttons of the operator panel can be used to control the motor. Furthermore, it is possible to set parameters such as rated motor current, limit values, etc. directly via the operator panel with display (with SIMOCODE pro V PROFIBUS as of E15, SIMOCODE pro V Modbus RTU as of E02 and with all SIMOCODE pro V PROFINET and EtherNet/IP).

**Communication**

SIMOCODE pro has either an integrated PROFIBUS DP or Modbus RTU interface (SUB-D or terminal connection) or a PROFINET or EtherNet/IP interface (2 x RJ45).

Fail-safe disconnection through PROFIBUS or PROFINET with the PROFIsafe profile is also possible in conjunction with a fail-safe controller (F-CPU) and the DM-F PROFIsafe fail-safe digital module.

SIMOCODE pro PROFIBUS

SIMOCODE pro PROFIBUS supports, for example:

- Cyclic services (DPV0) and acyclic services (DPV1)
- Extensive diagnostics and hardware interrupts
- Time stamp with high timing precision (SIMATIC S7) for SIMOCODE pro V
- DPV1 communication after the Y-Link

SIMOCODE pro PROFINET

SIMOCODE pro PROFINET supports, for example:

- Line and ring bus topology thanks to an integrated switch
- Media redundancy via MRP protocol
- Operating, service and diagnostics data via standard web browser
- OPC UA server for open communication with visualization and control system
- NTP-synchronized time
- Interval function and measured values for energy management via PROFInergy
- Module exchange without PC memory module through proximity detection
- Extensive diagnostics and maintenance alarms

System redundancy with SIMOCODE pro PROFINET

The device supports the system redundancy mechanisms of PROFINET IO and therefore can be operated directly on fault-tolerant systems such as SIMATIC S7-400 H. As such, SIMOCODE pro can provide decisive added value also for the field level of plants in which plant availability and control system redundancy are priorities.

SIMOCODE pro Modbus RTU

SIMOCODE pro Modbus RTU supports, for example:

- Communication at 1 200/2 400/4 800/9 600/19 200 or 57 600 baud
- Access to freely parameterizable process image via Modbus RTU
- Access to all operating, service and diagnostics data via Modbus RTU

SIMOCODE pro EtherNet/IP

SIMOCODE pro EtherNet/IP supports, for example:

- Line and ring bus topology thanks to an integrated switch
- Ring structures via Device Level Ring (DLR) protocol
- Operating, service and diagnostics data via standard web browser
- NTP-synchronized time
- Parameter assignment via SIMOCODE ES V14 – via local device interface and Ethernet

## SIMOCODE pro 3UF7

## General data

Notes on safety

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement (and continuously maintain) a holistic, state-of-the-art industrial security concept. Siemens products and solutions represent only one component of such a concept.

For more information on industrial security, see [www.siemens.com/industrialsecurity](http://www.siemens.com/industrialsecurity).

For SIMOCODE pro motor management and control devices with communication function, see from page 3/73.

Accessories, see from page 3/79.

**Autonomous operation**

An essential feature of SIMOCODE pro is the autonomous execution of all protection and control functions, even when communication to the I&C system is interrupted. This means that even in the event of bus system or automation system failure, full functionality of the feeder is ensured or a specific behavior can be parameterized in case of such a fault, e.g. targeted shutdown of the feeder or execution of particular parameterized control mechanisms (such as reversal of the direction of rotation).

**Advantages through energy efficiency**

Overview of the energy management process

We offer you a unique portfolio for efficient energy management in the industry – a process that is used to optimize the energy requirements. We split up our industrial energy management into three phases – identify, evaluate, and realize – and we support you with the appropriate hardware and software solutions in every process phase.

The innovative SIRIUS industrial controls products can also make a major contribution to the energy efficiency of a plant ([www.siemens.com/sirius/energysaving](http://www.siemens.com/sirius/energysaving)).

The SIMOCODE pro 3UF7 motor management system makes the following contribution to the energy efficiency of the plant as a whole:

- **Energy consumption:**  
Clear display of the energy consumption of a motor feeder or process element by means of the acquisition and transmission of all operating and consumption data, such as current, voltage, active and reactive power, energy consumption, motor temperature, etc.
- **Energy management:**  
Evaluation of measured energy values (e.g. limit value monitoring) with exporting of local or central actions (= forwarding to higher-level)
- **PROFenergy:**  
SIMOCODE pro V PROFINET supports the PROFenergy functions. Reduced energy consumption thanks to automatic disconnection in the intervals and forwarding of the measured values for higher-level energy management systems.

**Advantages from integrated energy management**

[siemens.com/energysuite](http://siemens.com/energysuite)

Ready for  
SIMATIC  
Energy Suite

As an integrated option for the TIA Portal, the SIMATIC Energy Suite couples energy management with automation efficiently, making energy consumption at your production facility transparent.

Thanks to the simplified configuration of energy-measuring components, e.g. SIMOCODE pro V, configuration effort is also clearly reduced.

Thanks to the end-to-end connection with higher-level energy management systems or cloud-based services, you can seamlessly expand the recorded energy data to create a cross-site energy management system.

The advantages at a glance:

- Automatic generation of energy management data
- Integration into TIA Portal and into automation
- Simple configuration

For more information, see [www.siemens.com/energysuite](http://www.siemens.com/energysuite).

## SIMOCODE pro 3UF7

## Technical data

## Application

SIMOCODE pro is often used for automated processes where plant downtimes are very expensive (e.g. chemical, oil/gas, water/wastewater, steel or cement industries) and where it is important to prevent plant downtimes through detailed operational, service and diagnostics data or to locate faults very quickly when they occur.

SIMOCODE pro is modular and space-saving and suited especially for operation in motor control centers (MCCs) in the process industry and for power plant technology.

## Applications

Protection and control of motors in hazardous areas for types of protection EEx e/d according to ATEX guideline 94/9/EC

- With heavy starting (paper, cement, metal and water industries)
- In high-availability plants (chemical, oil, raw material processing industries, power plants)

## Use of SIMOCODE pro 3UF7 with IE3/IE4 motors

## Note:

When using the SIMOCODE pro 3UF7 in conjunction with highly energy-efficient IE3/IE4 motors, please observe the information on dimensioning and configuring; see [Application Manual "SIRIUS Controls with IE3/IE4 motors"](#), <https://support.industry.siemens.com/cs/ww/en/view/94770820>.

## Safety technology for SIMOCODE pro

The safe disconnection of motors in the process industry is becoming increasingly important as the result of new and revised standards and requirements in the safety technology field.

With the DM-F Local and DM-F PROFIsafe fail-safe expansion modules it is easy to integrate functions for fail-safe disconnection into the SIMOCODE pro V motor management system while retaining service-proven concepts. The strict separation of safety functions and operational functions proves particularly advantageous for planning, configuring and construction. Seamless integration in the motor management system leads to greater transparency for diagnostics and during operation of the system.

Suitable components for this purpose are the DM-F Local and DM-F PROFIsafe fail-safe expansion modules, depending on the requirements:

- The DM-F Local fail-safe digital module for when direct assignment between a fail-safe hardware shutdown signal and a motor feeder is required, or
- The DM-F PROFIsafe fail-safe digital module for when a fail-safe controller (F-CPU) creates the signal for disconnection and transmits it in a fail-safe manner through PROFIBUS/PROFIsafe or PROFINET/PROFIsafe to the motor management system

# SIMOCODE pro 3UF7

## Technical data

### More information

#### Configuration instructions when using an operator panel with display and/or a decoupling module with SIMOCODE pro V with PROFIBUS or Modbus RTU

If you want to use an operator panel with display and/or a decoupling module in the SIMOCODE pro V system with PROFIBUS (product version earlier than E15) or Modbus RTU (product version earlier than E02), configuration instructions concerning the type and number of connectable expansion modules must be observed.

The following tables show the maximum possible configuration of the expansion modules for the various combinations. These are also conveniently stored in the TIA Selection Tool. See [www.siemens.com/tia-selection-tool](http://www.siemens.com/tia-selection-tool).

The DM-F Local and DM-F PROFIsafe fail-safe expansion modules behave in this connection like digital modules for standard applications.

#### Use of an operator panel with display

Digital module 1	Digital module 2	Analog module	Temperature module	Ground-fault module
<b>Only operator panel with display for SIMOCODE pro V (24 V DC or 110 ... 240 V AC/DC)</b>				
Max. four expansion modules can be used				
<b>Operator panel with display and current/voltage measurement with SIMOCODE pro V (110 ... 240 V AC/DC)</b>				
Max. three expansion modules can be used or:

#### Protective separation

All circuits in SIMOCODE pro are safely isolated from each other in accordance with IEC 60947-1. That is, they are designed with double creepages and clearances. In the event of a fault, therefore, no parasitic voltages can be formed in neighboring circuits. The instructions of Test log No. 2668 must be complied with.

#### Types of protection EEx e and EEx d

The overload protection and the thermistor motor protection of the SIMOCODE pro system comply with the requirements for overload protection of explosion-proof motors to the type of protection:

- EEx d "flameproof enclosure" e.g. according to IEC 60079-1
- EEx e "increased safety" e.g. according to IEC 60079-7

When using SIMOCODE pro devices with a 24 V DC control voltage, electrical separation must be ensured using a battery or a safety transformer according to IEC 61558-2-6. EC type-examination certificate BVS 06 ATEX F 001 Test report: BVS PP 05.2029 EG.

#### Expansion modules for SIMOCODE pro V

With SIMOCODE pro V, it is possible to expand the type and number of inputs and outputs in steps. Each expansion module has two system interfaces on the front. Through the one system interface the expansion module is connected to the system interface of the SIMOCODE pro V using a connection cable; through the second system interface, further expansion modules or the operator panel can be connected. The power supply for the expansion modules is provided by the connection cable through the basic unit.

**Note:**

Please order connection cable separately, [see page 3/79](#).

#### Digital modules

Up to two digital modules can be used to add additional binary inputs and relay outputs to the basic unit. The input circuits of the digital modules are supplied from an external power supply.

Four binary inputs and two relay outputs  
Up to two digital modules can be connected

Relay outputs	Input voltage			
Monostable	24 V DC	▶	<b>3UF7300-1AB00-0</b>	1 1 unit
	110 ... 240 V AC/DC	▶	<b>3UF7300-1AU00-0</b>	1 1 unit
Bistable	24 V DC	▶	<b>3UF7310-1AB00-0</b>	1 1 unit
	110 ... 240 V AC/DC	▶	<b>3UF7310-1AU00-0</b>	1 1 unit

#### Analog module

By means of the analog module, the basic unit can be optionally expanded with analog inputs and outputs (0/4 ... 20 mA).

Two inputs (passive) for input and one output for output of 0/4 ... 20 mA signals, max. one analog module can be connected per pro V basic unit and max. two analog modules per pro V PN basic unit

#### Ground-fault modules<sup>1)</sup>

Ground-fault monitoring using 3UL23 residual-current transformers and ground-fault modules is used in cases where precise detection of the ground-fault current is required or power systems with high impedance are grounded.

With the ground-fault module, it is possible to determine the precise fault current as a measured value, and to define freely selectable warning and trip limits in a wide range from 30 mA ... 40 A.

One input for connecting a 3UL23 residual-current transformer, up to one ground-fault module can be connected

**Note:**

For corresponding residual-current transformers, [see page 11/66 or Industry Mall](#).

#### Temperature modules

Irrespective of the thermistor motor protection of the basic units, an additional max. three analog temperature sensors can be evaluated using a temperature module.

Sensor types: PT100/PT1000, KTY83/KTY84 or NTC

Three inputs for connecting up to three analog temperature sensors, up to one temperature module can be connected per pro V basic unit and up to two temperature modules per pro V PN basic unit

### Expansion modules for SIMOCODE pro S

With SIMOCODE pro S, it is possible to expand the type and number of inputs and outputs. The expansion module has two system interfaces on the front. Through the one system interface the expansion module is connected to the system interface of the SIMOCODE pro S using a connection cable; through the second system interface, the operator panel can be connected. The power supply for the expansion module is provided by the connection cable through the basic unit.

Note:

Please order connection cable separately, [see page 3/79](#).

### Multifunction modules

The multifunction module is the expansion module of the SIMOCODE pro S device series with the following functions:

- Digital module function with four digital inputs and two monostable relay outputs
- Ground-fault module function with an input for the connection of a 3UL23 residual-current transformer with freely selectable warning and trip limits in a wide zone of 30 mA ... 40 A
- Temperature module function with an input for connecting an analog temperature sensor PT100, PT1000, KTY83, KTY84, or NTC

Max. one multifunction module can be connected per pro S basic unit

Input voltage of the digital inputs:

- 24 V DC
- 110 ... 240 V AC/DC

#### Fail-safe expansion modules for SIMOCODE pro V

Thanks to the fail-safe expansion modules, SIMOCODE pro V can be expanded with the function of a safety relay for the fail-safe disconnection of motors. A maximum of one fail-safe digital module can be connected; it can be used instead of a digital module.

The fail-safe expansion modules are equipped likewise with two system interfaces at the front for making the connection to other system components. Unlike other expansion modules, power is supplied to the modules through a separate terminal connection.

**Note:**

Please order connection cable separately, [see page 3/79](#).

#### DM-F Local fail-safe digital modules

For fail-safe disconnection using a hardware signal  
Two relay enabling circuits, joint switching; two relay outputs, common potential disconnected fail-safe; inputs for sensor circuit, start signal, cascading and feedback circuit, safety function adjustable using DIP switches

## Accessories

Version	SD	Article No.	Price per PU	PU (UNIT, SET, M)	PS*
---------	----	-------------	--------------	-------------------	-----

### Accessories for motor control centers

With the draw-out technology often used in motor control centers it is possible to integrate a SIMOCODE pro initialization module in the switchboard on a permanent basis. Feeder-related parameter and address data can then be permanently assigned to this feeder.

3UF7902-0AA00-0

#### Initialization module

For automatic parameterization of SIMOCODE pro S and SIMOCODE pro V basic units (pro V PROFIBUS basic units from product version E09)

▶	<b>3UF7902-0AA00-0</b>	1	1 unit
---	------------------------	---	--------

#### Y connection cable

For use in conjunction with the initialization module; connects the basic unit, current measuring module or current/voltage measuring module, and initialization module

System interface length	Open cable end
0.1 m	1.0 m
0.5 m	1.0 m
1.0 m	1.0 m

## SIRIUS 3RA6 Compact Starters

## General data

## Overview

**3RA6 fuseless compact starters and infeed system for 3RA6**

3RA62 reversing starter

Integrated functionality

The SIRIUS 3RA6 compact starters are a generation of innovative load feeders with the integrated functionality of a motor starter protector, contactor and electronic overload relay. In addition, various functions of optional mountable accessories (e.g. auxiliary switches, surge suppressors) are already integrated in the SIRIUS compact starter.

3RA6 compact starters with the integrated functionality of a motor starter protector, contactor and electronic overload relay.

Applications

The SIRIUS compact starters can be used wherever standard three-phase motors up to 32 A (20 HP/460 V) are directly started.

The compact starters are not suitable for the protection of DC loads.

Approvals according to IEC, UL, CSA and CCC standards have been issued for the compact starters.

Low variance of devices

Thanks to wide setting ranges for the rated current and wide voltage ranges, the equipment variance is greatly reduced compared to conventional load feeders.

Very high operational reliability

The high short-circuit breaking capacity and defined shut-down when the end of service life is reached means that the SIRIUS compact starter achieves a very high level of operational reliability that would otherwise have only been possible with considerable additional outlay. This sets it apart from devices with similar functionality.

Safe disconnection

The auxiliary switches (NC contacts) of the 3RA6 compact starters are designed as mirror contacts. This enables their use for safe disconnection - e.g. EMERGENCY STOP up to SIL 1 (IEC 62061) or PL c (ISO 13849-1) or, if used in conjunction with an additional infeed contactor, up to SIL 3 (IEC 62061) or PL e (ISO 13849-1).

Communications integration through AS-Interface

To enable communications integration through AS-Interface there is an AS-i add-on module available in several versions for mounting instead of the control circuit terminals on the SIRIUS compact starter.

The design of the AS-i add-on module permits a group of up to 62 feeders with a total of four cables to be connected to the control system. This reduces wiring work considerably compared to the parallel wiring method.

Communications integration using IO-Link

Up to 4 compact starters in IO-Link version (reversing and direct-on-line starters) can be connected together and conveniently linked to the IO-Link master through a standardized IO-Link connection. The SIRIUS 4SI electronic modules are used e.g. as IO-Link masters for connection to the SIMATIC ET 200S distributed I/O system.

The IO-Link connection enables a high density of information in the local range.

Details of the communications integration using IO-Link, see [Chapter 14 Communications](#).

The diagnostics data of the process collected by the 3RA6 compact starter, e.g. short circuit, end of service life, limit position etc., are not only indicated on the compact starter itself but also transmitted to the higher-level control system through IO-Link.

Thanks to the optionally available operator panel, which can be installed in the control cabinet door, it is easy to control the 3RA6 compact starters with IO-Link from the control cabinet door.

Permanent wiring / easy replacement

Using the SIRIUS infeed system for 3RA6 (see page 4/16) it is possible to carry out the wiring in advance without a compact starter needing to be connected.

A compact starter is very easily replaced simply by pulling it out of the device without disconnecting the wiring.

Even with screw connections or mounting on a standard mounting rail there is no need to disconnect any wiring (on account of the removable main and control circuit terminals) in order to replace a compact starter.

Consistent solution from the infeed to the motor feeder

The SIRIUS infeed system for 3RA6 with integrated PE bar is offered as a user-friendly possibility of feeding in summation currents up to 100 A with a maximum conductor cross-section of 2/0 AWG and connecting the motor cable directly without additional intermediate terminals.

Screw and spring-type terminals

The SIRIUS compact starters and the infeed system for 3RA6 are available with screw and spring-type terminals.

## SIRIUS 3RA6 Compact Starters

## General data

To comply with the clearance and creepage distances demanded according to UL 508 there are the following infeed possibilities:

Type of infeed	Feeder terminal (according to UL 508, type E)	Type
Conventional wiring	Terminal block for "Self-Protected Combination Motor Controller (Type E)"	<b>3RV29 28-1H</b>
Three-phase busbars	Three-phase infeed terminal for constructing "Type E Starters", UL 508	<b>3RV29 25-5EB</b>
Infeed systems for 3RA6	Infeed on left, 50/70 mm <sup>2</sup> , screw terminal with 3 sockets, outgoing terminal with screw/spring-type connections, including PE bar	<b>3RA68 13-8AB</b> (screw terminals), <b>3RA68 13-8AC</b> (spring-type terminals)

**SIRIUS 3RA6 compact starters**

The SIRIUS 3RA6 compact starters are universal motor starters according to IEC/EN 60947-6-2. As control and protective switching devices (CPS) they can connect, convey and disconnect the thermal, dynamic and electrical loads from short-circuit currents up to  $I_{cs} = 53$  kA, i.e. they are essentially weld-free. They combine the functions of a motor starter protectors, a contactor and a solid-state overload relay in a single enclosure and can be used wherever standard induction motors up to 32 A (up to approx. 20 HP at 480 V AC) are started directly. Available versions are the direct-on-line starters with 45 mm width and the reversing starters with 90 mm width.

The reversing starter version comes with not only an internal electrical interlock but also with a mechanical interlock to prevent simultaneous actuation of both directions of rotation.

3RA6 compact starters are supplied in 5 current setting ranges. The 3RA61 and 3RA62 have 2 control voltage ranges (AC/DC), the 3RA64 and 3RA65 have one control voltage range (DC):

Current setting range	At 460 V AC for induction motors Standard output P HP	Rated control supply voltage for	
		3RA61, 3RA62 compact starters	3RA64, 3RA65 compact starters for IO-Link
A	HP	V AC/DC	V DC
0.1 ... 0.4	0.12	24	24
0.32 ... 1.25	0.43 ... 1.68	110 ... 240	
1 ... 4	1.34 ... 5.36		
3 ... 12	4.02 ... 16.1		
8 ... 32	10.7 ... 42.9		

Note:

*The 3RA1 motor starters can be used as motor starters > 32 A up to 100 A.*

*The SENTRON 3VL circuit breakers and the SIRIUS 3RT contactors can be used for motor starters > 100 A.*

Operating conditions

The SIRIUS 3RA6 compact starters are suitable for use in nearly all climates. They are intended for use in enclosed rooms in which no severe operating conditions (such as dust, caustic vapors, hazardous gases) prevail. Suitable covers must be provided for installation in dusty and damp locations.

The SIRIUS compact starters are generally designed to degree of protection IP20. The permissible ambient temperature during operation is -20 to +60 °C.

The maximum short-circuit current based on UL testing is 30 kA up to 12 A and 15 kA for the 8 ... 32 A versions at 480 V.

Note:

*More technical specifications can be found in the system manual at*

[www.siemens.com/compactstarter](http://www.siemens.com/compactstarter)

Overload tripping times

The overload tripping time can be set on the device to less than 10 s (CLASS 10) and less than 20 s (CLASS 20 for heavy starting). As the breaker mechanism still remains closed after an overload, resetting is possible by either local manual reset or autotrip after 3 minutes cooling time.

With autoreset there is no need to open the control cabinet.

Diagnostics options

The compact starter provides the following diagnostics options on site:

- With LEDs
  - Connection to the control voltage
  - Position of the main contacts
- With mechanical indication
  - Tripping due to overload
  - Tripping due to short-circuit
  - Tripping due to malfunction (end of service life reached because of worn switching contacts or a worn switching mechanism or faults in the control electronics)

These states can also be evaluated in the higher-level control system:

- With conventional wiring using the integrated auxiliary and signaling switches of the compact starter
- With AS-Interface or IO-Link in even greater detail using the respective communication interface

Four complement variants for 3RA6 compact starters

- For standard mounting rail or screw mounting: basic version including 1 pair of main circuit terminals and 1 pair of control circuit terminals
- For standard mounting rail or screw mounting when using the AS-i add-on module: comes without control circuit terminals because the AS-i add-on module is attached in lieu of them
- For use with the infeed system for 3RA6: without main circuit terminals because they are supplied with the infeed system and the expansion modules
- For use with the infeed system for 3RA6 and AS-i add-on module: without main or control circuit terminals as they are not needed
- The control circuit terminals are always required by the compact starters for IO-Link; the main circuit terminals depend on the use of the infeed system.

Additional components of the 3RA6

The two control circuit terminals on the 3RA61/3RA62 allow access to signalling contacts for overload (1 CO) and short-circuit / malfunction (1 NO). Furthermore, the 3RA61 has two auxiliary contacts (1 NO + 1 NC) for indicating the position of the main contacts, while the 3RA62 has one auxiliary contact (1 NO) per direction of rotation per main contact.

# 3RA6 Compact Starters

## Overview

### Function

#### Trip units

The SIRIUS 3RA6 compact starters are equipped with the following trip units:

- Inverse-time delayed solid-state overload release
- Instantaneous electronic trip unit (electromagnetic short-circuit release)

The overload releases can be adjusted in accordance with the load current.

The electronic trip units are permanently set to a value 13 times the maximum rated current of the 4 A, 12 A and 32 A starter and thus enable trouble-free starting of motors.

#### Trip classes

The trip classes of electronically delayed trip units are based on the tripping time ( $t_A$ ) at 7.2 times the set current in the cold state (excerpt from IEC 60947-4):

CLASS 10:  $4s < t_A < 10s$

CLASS 20:  $6s < t_A < 20s$  (for heavy starting)

The compact starter must trip within this time.

#### Disconnection due to malfunction

The following malfunctions can be detected:

- End of service life
  - Worn switching contacts (for electrical endurance see "Technical data")
  - Worn switching mechanisms (for mechanical endurance see "Technical data")
- Faults in the control electronics

#### Short-circuit protection

If a short-circuit occurs, the short-circuit releases of the SIRIUS 3RA6 compact starters isolate the faulty motor starter from the network and thus prevent further damage. The short-circuit releases are factory-set to 14 times the value of the maximum rated current  $I_n$  of the device.

The SIRIUS compact starters have a short-circuit breaking capacity up to 30 kA at a voltage of 480 V AC.

#### Overload relay function

In the event of an overload, the compact starter switches off without the breaker mechanism being opened.

The overload trip can be signaled to the higher-level control system through an integrated signal switch.

The overload signal can be reset automatically or by means of a manual reset.

#### Control through AS-Interface

For control through AS-Interface, the AS-i add-on module is mounted instead of the two control circuit terminals on the SIRIUS 3RA6 compact starters (direct-on-line starters and reversing starters).

The AS-i auxiliary voltage and the AS-i data line are installed on the AS-i add-on module easily and quickly without tools by means of two plug-in connector blocks with insulation displacement connection.

The AS-i add-on module is equipped with the latest A/B technology and has an addressing socket onboard.

An addressing unit is required and can be ordered for addressing the AS-i add-on module.

Bit assignment (see below) is similar to that for the SIRIUS motor starters, which means that the same programming can be used here.

DI 0.0 ready
DI 0.1 motor on
DI 0.2 group fault
DI 0.3 group warning

DO 0.0 motor on or motor clockwise
DO 0.1 motor counterclockwise

A 24 V DC PELV power supply unit according to EN 61140 safety class III is required for the auxiliary voltage.

The AS-i data line is supplied with voltage by means of a 30 V DC AS-i power supply unit and is controlled by means of the AS-i master.

The AS-i add-on modules are available in the following five versions:

- AS-i add-on module for compact starters
- AS-i add-on module for compact starters with two local inputs for safe disconnection of the "clockwise rotation" or "counterclockwise rotation" outputs
- AS-i add-on module with two free external inputs
- AS-i add-on module with two free external outputs
- AS-i add-on module with one free external input and output

The AS-i add-on module can only be used with compact starters with a control voltage of 24 V AC/DC.

#### Integrated auxiliary switches

The control circuit terminals of the SIRIUS 3RA6 compact starters have the following connections:

- A1/A2 for the control voltage for 3RA61, A1/A2 and B1/B2 for the control voltage for 3RA62
- "Overload" signal switch
- "Fault" signal switch, e. g. "short-circuit"
- Internal auxiliary switch for position of the main contacts (in case of direct-on-line starters: 1 NO + 1 NC with mirror contact to the main contact; in case of reversing starters: 2 NO)

# 3RA6 Compact Starters

## Overview

### Design

#### Mounting

The 3RA6 compact starters can be mounted in 4 ways:

1) By snapping onto a TH 35 standard mounting rail

The SIRIUS compact starters can be snapped onto a standard mounting rail according to EN 60715 with a width of 35 mm.

2) By screw fixing to a flat surface

The SIRIUS compact starters are suitable for screw fixing to a flat surface. One set of 3RA69 40-0A adapters for screw connection (including push-in lugs) is required per direct-on-line starter, two sets are required per reversing starter.

1 ... 5: order of mounting steps

3) By integrating in the infeed system for 3RA6

The SIRIUS compact starters can be assembled with the infeed system for 3RA6 (see "Infeed system for 3RA6").

4) By using the 8US busbar adapter for Fast Bus systems with 60 mm busbar center-to-center clearance

1 ... 6: order of mounting steps

# 3RA6 Compact Starters

## Overview

### 4a) By using an additional device holder in the case of reversing starters

When the 8US busbar adapter is used on Fast Bus systems with 60 mm busbar center-to-center clearance, a device holder is needed in addition for a reversing starter on account of its double width.

The reversing starter is mounted in the same way as the direct-on-line starter on the busbar adapter. Then the device holder is snapped on alongside the busbar adapter.

### Mounting regulations

The module can be installed horizontally or vertically. For the different installations attention must be paid however to limit values for protective separation according to IEC/EN 60947-2 of the compact starters (for details see the "Technical specifications").

The following distances must be observed when mounting the compact starters:

- Lateral clearance to grounded components: 10 mm
- Arcing space at top and bottom: 30 mm

# SIRIUS 3RA6 Compact Starters

## Accessories

### Overview

#### Accessories for SIRIUS 3RA6 compact starters

The following accessories are available for the 3RA6 compact starters:

- AS-i add-on module: [see AS-Interface Add-On Modules for 3RA6, page 4/14](#)
- External auxiliary switch blocks: Snap-on auxiliary switch as versions 2 NO, 2 NC and 1 NO +1 NC with screw or spring-type connections; the contacts of the auxiliary switch block open and close jointly with the main contacts of the compact starter. The NC contacts are designed as mirror contacts.
- Control kit: aid for manually closing the main contacts in order to evaluate the wiring and motor direction under conditions of short-circuit protection
- Adapter for screw mounting the compact starter, including push-in lugs
- Main circuit terminals: Available in screw and spring-type terminals
- Main circuit terminals for mixed connection method: With the main circuit terminal for the mixed connection method it is also possible in the main circuit to change over from the screw connection method on the incoming side to the spring-type connection method on the outgoing side. This enables for example the side-by-side mounting of several compact starters and their cost-effective connection using the three-phase busbars on the infeed side. The motors are then directly connected by the quick and reliably contacting spring-type connection method.

#### Accessories for UL applications

The terminal block for "Self-Protected Combination Motor Controller", type E is available for complying with the clearance and creepage distances according to UL 508.

#### Accessories for infeed using three-phase busbar systems

The three-phase busbars can be used as an easy, time-saving and clearly arranged means of feeding SIRIUS 3RA6 compact starters with screw connection. Motor starter protectors size S00 and S0 can also be integrated.

The busbars are suitable for between 2 and 5 devices. However, any kind of extension up to a maximum summation current of 63 A is possible by clamping the terminals of an additional busbar (rotated by 180°) underneath the terminals of the respective last motor circuit protector.

A connecting piece is required for the combination with motor starter protector size S00. S00 and S0 motor starter protectors of the 3RV2 series do not require the additional connecting piece. The motor starter protectors are supplied by appropriate feeder terminals. Special feeder terminals are required for constructing "Type E Starters" according to UL/CSA.

The three-phase busbar systems are finger-safe but empty connection terminals must be fitted with covers. They are designed for any short-circuit stress which can occur at the output side of connected SIRIUS 3RA6 compact starters or motor starter protectors.

#### 8US Fast Bus busbar adapters for 60 mm systems

The compact starters are mounted directly with the aid of busbar adapters on the Fast Bus busbar systems with 60 mm center-to-center clearance in order to save space and to reduce infeed times and costs. These starters are suitable for copper busbars with a width from 12 to 30 mm. The busbars can be 4 to 5 mm or 10 mm thick.

The 8US Fast Bus busbar system can be loaded with a maximum summation current of 630A.

The "reversing starter" version requires a device holder along side the busbar adapter for lateral mounting.

The compact starters are snapped onto the adapter and connected on the line side. This prepared unit is then plugged directly onto the busbar system, and is thus connected both mechanically and electrically at the same time.

For more accessories such as incoming and outgoing terminals, flat copper profiles etc., [see Section 5 "Fastbus Busbar Systems"](#).

#### Accessories for operation with closed control cabinet doors

Door-coupling rotary operating mechanisms for standard and emergency-stop applications are available for operating the compact starter with closed control cabinet doors.

#### Accessories for SIRIUS 3RA6 compact starters in IO-Link version

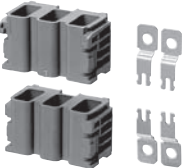

The following accessories are available specifically for the 3RA64, 3RA65 compact starters:

- The 4SI SIRIUS solid-state module as IO-Link master allows for the simple and economical connection of SIRIUS controls with IO-Link (e.g up to four groups of 4 compact starters) to the multifunctional SIMATIC ET 200S distributed I/O system.
- Additional connection cables for side-by-side mounting of up to 4 compact starters
- Operator panel for local control and diagnostics of up to 4 compact starters coupled to each other

Version	Order No.	Std. pack qty.	Weight approx. kg
---------	-----------	----------------	-------------------

### 8US Fast Bus busbar adapters for 60 mm systems

8US12 11-1NS10

For flat copper profiles according to DIN 46433  
Width: 12 ... 30 mm  
Thickness: 4 ... 5 mm or 10 mm

**8US12 11-1NS10**

1 unit

0.337

### Device holders for lateral mounting along side the Fast Bus busbar adapter for 60 mm systems

8US12 50-1AA10

Required in addition to the busbar adapter for mounting a reversing starter

**8US12 50-1AA10**

1 unit

0.239

Version	Color of handle	Version of extension shaft mm	Order No.	Std. pack qty.	Weight approx. kg
---------	-----------------	-------------------------------	-----------	----------------	-------------------

### Door-coupling rotary operating mechanisms for operating the compact starter with closed control cabinet doors

3RV29 26-0B

The door-coupling rotary operating mechanisms consist of a knob, a coupling driver and an extension shaft of 130/330 mm in length (6 mm x 6 mm). The door-coupling rotary operating mechanisms are designed to degree of protection IP65. The door interlocking prevents accidental opening of the control cabinet door in the ON position of the motor starter protector. The OFF position can be locked with up to 3 padlocks.

# SIRIUS 3RA6 Compact Starters

## Add-on modules for AS-Interface

### Overview

Various AS-i add-on modules are available for communication of the 3RA6 compact starter with the control system using AS-Interface:

- Standard version
- With two local inputs
- With two free external inputs
- With one free external input and one free external output
- With two free external outputs
- For local control

The AS-i add-on modules can be combined only in connection with compact starters with a rated control supply voltage of 24 V AC/DC.

#### AS-i add-on module for communications controlling

With this new module it is also possible for the connected compact starter to be operated directly using simple switches, i.e. without recourse to AS-i Communication, if required.

#### "Automatic" mode

NC contacts can be connected to the inputs Y2 and Y4 through the local terminals on the AS-i add-on module. If the "+" connections are connected simultaneously to both local inputs, the AS-i add-on module will be in "Automatic" mode, i.e. it will communicate with the control system through AS-Interface.

#### Local control

Opening the two inputs Y2 and Y4 will result in the direct disconnection of the compact starter. Operation through AS-i Communication is ended and the compact starter can now be switched on and off directly using NO contacts (one NO contact per direction of rotation on the reversing starter).

"LED AUX Power" must light up green, the 24 V DC supply must be connected and the AS-i control supply voltage must no longer be applied.

#### Resetting to "Automatic" mode

Simultaneous application of a "1" signal at the local inputs. The availability bit DI 0 is switched to a "1" signal.

If AS-i Communication is reset, the motor is first switched off and then on again when requested by the control system.

Circuit diagram example for operating a 3RA61 20 direct-on-line starter using an AS-i add-on module for on-site controller

Circuit diagram example for operating a 3RA62 50 reversing starter using an AS-i add-on module for on-site controller

# 3RA6 Compact Starters

Infeed systems for 3RA6 – up to 100 A

## Overview

The infeed system for 3RA6 compact starters enables far less wiring in the main circuit and, thanks to the easy exchangeability of the compact starters, reduces the usual downtimes for maintenance work during the plant's operating phase.

The infeed system provides the possibility of completely prewiring the main circuit without a compact starter needing to be connected at the same time. As the result of the removable terminals in the main circuit, compact starters can be integrated in an infeed system in an easy manner (without the use of tools).

In addition, the integrated PE bar means it is optionally possible to connect the motor cable directly to the infeed system without additional intermediate terminals. The infeed system for 3RA6 compact starters is designed for summation currents up to 100 A with a conductor cross-section of max. 2/0 AWG on the feeder terminal block.

The infeed system can be mounted on a standard mounting rail or flat surfaces.

COMBINATION  
STARTERS

Infeed system for 3RA6 compact starters

# SIRIUS 3RA6 Compact Starters

## Infeed systems for 3RA6 – up to 100 A

### 1 Infeed

The 3-phase infeed is available as an infeed with screw connection (4-2 AWG up to 63 A or 0-2/0 AWG up to 100 A) and an infeed with spring-type connection (4-2 AWG up to 63 A).

The infeed with spring-type terminal can be attached to the left side, as well as the right side, of an expansion module.

The screw terminal infeeds are permanently fitted to the left side of a 3-socket expansion module.

The infeeds with screw connection enable connection of the main conductors (L1, L2, L3) either from above or from below.

The infeeds with screw connection come packaged with 1 end cover, while the infeed with spring-type connection comes packaged with 2 end covers.

### 2 Three-socket expansion modules

The expansion module with 3 sockets for compact starters is available with screw connection and with spring-type connection.

Expansion modules enable the infeed system to be expanded and can be connected to each other in any number up to a maximum length of 1.2 meters.

Two expansion modules are held together with the help of 2 connecting plates and 1 expansion plug. These assembly parts are included in the scope of supply of the respective expansion module.

When the infeed system for 3RA6 compact starters is used, the compact starters (plug-in modules) are easily mounted and removed even when live.

Optional possibilities:

- PE connection on motor starter side
- Outfeed for external auxiliary devices
- Connection to 3RV29 infeed system
- Integration of SIRIUS 3RV1 and 3RV2 motor starter protectors size S0 up to 25 A (using 3RA68 90-0BA adapter)

### 3 Two-socket expansion modules

If only 2 instead of 3 additional sockets are required, then the 2-socket expansion module is the right choice. It has the same functionality as the 3-socket expansion module.

### 4 Expansion plug

Two expansion modules can be connected together using the expansion plug. Flexible expansion of the infeed system is thus possible.

### 5 PE infeeds

This module enables a PE cable to be connected.

The PE infeed can be ordered with screw connection and spring-type connection (2 AWG) and can be fitted on the right or left to the expansion block.

### 6 PE expansion plug

The PE expansion plug is inserted from below and enables two PE bars to be connected.

### 7 PE tap-off

The PE tap-off is available with screw connection and spring-type connection (10-8 AWG). It is snapped into the infeed system from below.

### 8 Connecting plates

Two connecting plates are used to hold together 2 adjacent expansion modules.

### 9 End covers

On the last expansion module of a row, the slot provided for the expansion plug can be covered by inserting the end cover.

### 10 45 mm adapters for SIRIUS 3RV motor starter protectors

SIRIUS 3RV1 and 3RV2 motor starter protectors size S0 with screw connection can be fitted to the adapter, enabling them to be plugged into the infeed system.

### Terminal blocks

Using the terminal block, three phase power can be fed out of the infeed system; this means that single-phase, two-phase and three-phase components can also be integrated in the system.

If the end cover is removed, the terminal block can be inserted into an expansion module.

### Expansion plug for SIRIUS 3RV29 infeed systems

If the end cover is removed, the expansion plug for the SIRIUS 3RV29 infeed system can be inserted into an expansion module. It connects the infeed system for 3RA6 compact starters with the SIRIUS 3RV29 infeed system.

### Maximum rated operational current

The following maximum rated operational currents apply for the components of the infeed system for 3RA6:

Component	Maximum rated operational current A
Infeed with screw connection 0-2/0 AWG	100
Infeed with screw connection 4-2 AWG	63
Infeed with spring-type connection 4-2 AWG	63
Expansion plugs	63

When several expansion modules are mounted side by side, the maximum rated operational current from the 2nd expansion module to the end of the row is 63 A.

### Proposal for upstream short-circuit protection devices

The following short-circuit data apply for the components of the infeed system for 3RA6 compact starters:

Conductor cross-section AWG	Inscriptions	Proposal for upstream short-circuit protection device
<b>Short-circuit protection for infeed block (4-2 AWG) with screw connection</b>		
14-2	$I_{d, \max} = 19 \text{ kA}$ , $I^2t = 440 \text{ kA}^2\text{s}$	<b>3RV10 41-4JA10</b>
<b>Short-circuit protection for infeed block (0-2/0 AWG) with screw connection</b>		
14-2/0	$I_{d, \max} = \text{approx. } 22 \text{ kA}$	<b>3RV10 41-4MA10</b>
<b>Short-circuit protection for infeed block with spring-type connection</b>		
12	$I_{d, \max} = 9.5 \text{ kA}$ , $I^2t = 85 \text{ kA}^2\text{s}$	<b>3RV10 21-4DA10</b>
10	$I_{d, \max} = 12.5 \text{ kA}$ , $I^2t = 140 \text{ kA}^2\text{s}$	<b>3RV10 31-4EA10</b>
8	$I_{d, \max} = 15 \text{ kA}$ , $I^2t = 180 \text{ kA}^2\text{s}$	<b>3RV10 31-4HA10</b>
6-4	$I_{d, \max} = 19 \text{ kA}$ , $I^2t = 440 \text{ kA}^2\text{s}$	<b>3RV10 41-4JA10</b>
<b>Short-circuit protection for terminal block</b>		
16	$I_{d, \max} = 7.5 \text{ kA}$	<b>5SY...</b> 1)
14	$I_{d, \max} = 9.5 \text{ kA}$	
12	$I_{d, \max} = 9.5 \text{ kA}$	
10	$I_{d, \max} = 12.5 \text{ kA}$	

1) To prevent the possibility of short-circuits, the cables on the terminal block must be installed so that they are short-circuit proof according to EN 60439-1 Section 7.5.5.1.2.

<b>Make-time</b>		ms	max. 70		Max. 70 + IO-Link communication
<b>Break-time</b>		ms	max. 120		Max. 120 + IO-Link communication

<sup>1)</sup> To maintain maximum interference immunity in a harsh electromagnetic environment, additional overvoltage protection should be provided in the control supply current circuit. A suitable choice is for example the Dehn Blitzductor BVT AD 24 V, Art. No. 918 402 or an equivalent protective element.

Manufacturer: DEHN+SÖHNE GmbH+Co. KG, Hans-Dehn-Straße, 1, Postfach 1640, D-92306 Neumarkt

Non-Reversing, AC Coil – up to 22 A

## Selection and ordering data

**Rated control supply voltage 50/60 Hz 110/120 V AC**  
**With screw connections**

- The motor starter protector and contactor are mechanically and electrically connected by means of the link module.
- Auxiliary switches<sup>1)</sup> on the motor starter protector and the contactor can be easily fitted due to the modular system.
- Integrated auxiliary switches:
  - Contactor size S00: 1 NO;
  - Contactor size S0: 1 NO + 1 NC

### Combination Starter, UL508 Type F

All size S00 and S0 devices can be applied as Combination Starters with the addition of either of these line side connectors: 3RV29 28-1H, 3RV29 25-5EB or 3RV29 28-1K.

Size	UL Data						FLA setting range inverse-time delayed overload release	Consisting of the following single devices			Assembled starter		Weight approx. kg

### Order No. supplement for:

- Standard DIN rail or screw mounting with no additional auxiliaries
- Standard DIN rail or screw mounting with 1 SPDT NO/NC MSP auxiliary (S00 frame contactor has 1NO auxiliary and S0 frame contactor has 1NO/1NC auxiliary)
- With Fast Bus adaptor and no additional auxiliaries
- With Fast Bus adaptor and 1 SPDT NO/NC MSP auxiliary (S00 frame contactor has 1NO auxiliary and S0 frame contactor has 1NO/1NC auxiliary)

0	A
5	A
0	D
5	D

1) For auxiliary switches see Accessories page 4/44.

2) Selection depends on the motor full load amps. HP ratings for reference only.

3) Used only for mounting starter on 8US Fast Bus busbar systems.

# 3RA2

Non-Reversing, AC and DC Coil – up to 100 A

## Selection and ordering data

### Direct-on-line starting

### For 35 mm standard mounting rail or screw mounting

- The motor starter protector and contactor are mechanically and electrically connected by means of the link module.
- Auxiliary switches<sup>1)</sup> on the motor starter protector and the contactor can be easily fitted due to the modular system.
- Integrated auxiliary switches:
  - Contactor size S2: 1 NO & 1 NC
  - Contactor size S3: 1 NO & 1 NC

### Combination Starter, UL508 Type F

- Size S2 devices can be applied as Combination Starters. For versions of 50A or higher, the addition of a 3RV2938-1K line side phase barrier is required.
- Size S3 devices can be applied as Combination Starters with the addition of a 3RT2946-4GA07 line side terminal kit

### Order No. supplement for:

- Standard DIN rail or screw mounting with no additional auxiliaries **0** **0**
- Standard DIN rail or screw mounting with 1 SPDT NO/NC MSP auxiliary (S2 frame contactor has 1NO/1NC integrated auxiliary) **5** **0 (S2)**
- Standard DIN rail or screw mounting with 1 SPDT NO/NC MSP auxiliary (S3 frame contactor has 1NO top mounted auxiliary) **5** **1 (S3)**

- 1) For auxiliary switches, see accessories page 4/44.
- 2) Selection depends on motor full load amps. Horsepower ratings for reference only.
- 3) Adapters for standard mounting rail are included for all S3 starters and optional to be ordered as accessories for S2 non-reversing starters.

### Note:

In the S2 frame, for 100kA SCCR versions, replace the prefix 3RA213x with 3RA215x. Rating exceptions would be the 59A and 65A versions having a 30kA SCCR at 480Y/277V. For UL 508 type E/F, order 3RV2938-1K Phase Barrier for field installation on all versions.

# 3RA2

Non-Reversing, DC Coil – up to 22 A

**Rated control supply voltage 24 V DC**  
**With screw connections**

- The motor starter protector and contactor are mechanically and electrically connected by means of the link module.
- Auxiliary switches<sup>1)</sup> on the motor starter protector and the contactor can be easily fitted due to the modular system.
- Integrated auxiliary switches:
  - Contactor size S00: 1 NO;
  - Contactor size S0: 1 NO + 1 NC

**Combination Starter, UL508 Type F**

All size S00 and S0 devices can be applied as Combination Starters with the addition of either of these line side connectors: 3RV29 28-1H, 3RV29 25-5EB or 3RV29 28-1K.

**Order No. supplement for:**

- Standard DIN rail or screw mounting with no additional auxiliaries
- Standard DIN rail or screw mounting with 1 SPDT NO/NC MSP auxiliary (S00 frame contactor has 1NO auxiliary and S0 frame contactor has 1NO/1NC auxiliary)
- With Fast Bus adaptor and no additional auxiliaries
- With Fast Bus adaptor and 1 SPDT NO/NC MSP auxiliary (S00 frame contactor has 1NO auxiliary and S0 frame contactor has 1NO/1NC auxiliary)

0	A
5	A
0	D
5	D

1) For auxiliary switches, see Accessories page 4/44.  
 2) Selection depends on the concrete motor full load amps. HP ratings for reference only.  
 3) Use only for mounting starter on 8US Fast Bus busbar systems.

# 3RA2 Starters

## Non-Reversing Fast Bus® – AC and DC Coil

### Selection and ordering data

#### Direct-on-line starting

#### For 60mm Fast Bus busbar systems

- The motor starter protector and contactor are mechanically and electrically connected by means of the link module.
- Auxiliary switches<sup>1)</sup> on the motor starter protector and the contactor can be easily fitted due to the modular system.
- Integrated auxiliary switches:
  - Contactor size S2: 1 NO & 1 NC
  - Contactor size S3: 1 NO & 1 NC

#### Combination Starter, UL508 Type F

- Size S2 devices can be applied as Combination Starters. For versions of 50A or higher, the addition of a 3RV2938-1K line side phase barrier is required.
- Size S3 devices can be applied as Combination Starters with the addition of a 3RT1946-4GA07 line side terminal kit

#### Order No. supplement for:

- Standard DIN rail or screw mounting with no additional auxiliaries **0 0**
- Standard DIN rail or screw mounting with 1 SPDT NO/NC MSP auxiliary (S2 frame contactor has 1NO/1NC integrated auxiliary) (S3 frame contactor has 1NO top mounted auxiliary) **5 0 (S2)**  
**5 1 (S3)**

1) For auxiliary switches, see Accessories page 4/44.  
2) Selection depends on motor full load amps. Horsepower ratings for reference only.

#### Note:

In the S2 frame, for 100kA SCCR versions, replace the prefix 3RA213x with 3RA215x. Rating exceptions would be the 59A and 65A versions having a 30kA SCCR at 480Y/277V. For UL 508 type E/F, order 3RV2938-1K Phase Barrier for field installation on all versions.

# 3RA2 Starters

Reversing, AC Coil – up to 22 A

## Selection and ordering data

Reversing duty

### Rated control supply voltage 50/60 Hz 110/120 V AC With screw connections

- The motor starter protector and contactor are mechanically and electrically connected by means of the link module.
- Auxiliary switches<sup>1)</sup> on the motor starter protector and the contactor can be easily fitted due to the modular system.
- With the contactor S0, an integrated NO contact is available for free use.

### Combination Starter, UL508 Type F

All size S00 and S0 devices can be applied as Combination Starters with the addition of either of these line side connectors: 3RV29 28-1H, 3RV29 25-5EB or 3RV29 28-1K.

- 1) For push-in lugs and auxiliary switches, see Accessories on pages 4/44 and 4/52.
- 2) Selection depends on the motor full load amps. HP ratings for reference only.
- 3) According to ordering option:  
RH = assembly kit for reversing duty with standard rail mounting adapter in size S0.  
RS = assembly kit for reversing duty with 8US Fast Bus busbar mounting.
- 4) With standard rail mounting or screw fixing, the 3RA29 13-2AA1 wiring kit is required for size S00.

# 3RA2

Reversing, AC Coil – up to 100 A

### Selection and ordering data

3RA12 40

### Reversing duty

### For 35 mm standard mounting rail or screw mounting

- All starters are suitable for use in Group Installation applications per NEC 430-53 (c)
- Motor starter protector and contactor are linked electrically and mechanically by means of a link module and adapter plate
- Starter includes both electrical and mechanical interlocks
- Auxiliary switches <sup>1)</sup> can be added easily to the MSP and the contactor

### Combination Starter, UL508 Type F

- Size S2 devices can be applied as Combination Starters. For versions of 50A or higher, the addition of a 3RV2938-1K line side phase barrier is required.
- Size S3 devices can be applied as Combination Starters with the addition of a 3RT1946-4GA07 line side terminal kit
- SCCR: 65kA at 480V

RH = Reversing duty for rail mounting.

1) For auxiliary switches, see Accessories page 4/44.

2) Selection depends on motor full load amps. Horse power ratings for reference only.

3) Adapters for standard mounting rail are also suitable for screw mounting.

4) Mechanical interlock must be ordered separately; see Accessories page 4/50

# 3RA2

Reversing, DC Coil – up to 22 A

Reversing duty

**Rated control supply voltage 24 V DC**  
With screw connections

- The motor starter protector and contactor are mechanically and electrically connected by means of the link module.
- Auxiliary switches<sup>1)</sup> on the motor starter protector and the contactor can be easily fitted due to the modular system.
- With the contactor S0, an integrated NO contact is available for free use.

**Combination Starter, UL508 Type F**

All size S00 and S0 devices can be applied as Combination Starters with the addition of either of these line side connectors: 3RV29 28-1H, 3RV29 25-5EB or 3RV29 28-1K.

1) For push-in lugs and auxiliary switches, see Accessories on pages 4/44 and 4/52.  
 2) Selection depends on the motor full load amps. HP ratings for reference only.  
 3) Code for abbreviations:  
 RH = assembly kit for reversing duty with standard rail mounting adapter in size S0.  
 RS = assembly kit for reversing duty with 8US Fast Bus busbar mounting.  
 4) With standard rail mounting or screw fixing, the 3RA29 13-2AA1 wiring kit and link module are required for size S00.

# 3RA2

## Reversing Fast Bus®, AC and DC Coil – up to 100 A

### Selection and ordering data

Representative image of assembled starter

### Reversing duty

### For 60 mm Fast Bus busbar systems

- All starters are suitable for use in Group Installation applications per NEC 430-53 (c)
- Motor starter protector and contactor are linked electrically and mechanically by means of a link module and mounted on a Fast-bus Shoe
- Starter includes both electrical and mechanical interlocks
- Auxiliary switches<sup>1)</sup> can be added easily to the MSP and the contactor
- Size S3 is kit form only - assembly required

### Combination Starter, UL508 Type F

- Size S2 devices can be applied as Combination Starters
- Size S3 devices can be applied as Combination Starters with the addition of a 3RT2946-4GA07 line side terminal kit
- SCCR: 65kA at 480V

## Auxiliary switches

### Overview

The accessories listed here are parts and add-ons for the 3RA2 direct-on-line and reversing starters as well as components for the customer assembly of motor starters

### Selection and ordering data

	For MSPs	Screw Terminals	⊕	Weight approx.	Spring-type Terminals	⊕	Weight approx.
	Size	Order No.		kg	Order No.		kg

### Auxiliary switches for motor starter protectors <sup>1</sup>

#### Transverse auxiliary switches

For front mounting

1 CO	S00 ... S3	<b>3RV29 01-1D</b>	0.014	—		
1 NO + 1 NC	S00 ... S3	<b>3RV29 01-1E</b>	0.016	<b>3RV29 01-2E</b>	0.016	

#### Lateral auxiliary switches

Mountable on the left

1 NO + 1 NC	S00 ... S3	<b>3RV29 01-1A</b>	0.036	<b>3RV29 01-2A</b>	0.035	
-------------	------------	--------------------	-------	--------------------	-------	--

<sup>1</sup> One transverse auxiliary switch and one lateral auxiliary switch can be attached per motor starter protector.  
When the lateral auxiliary switch with 2 NO + 2 NC is used, a transverse auxiliary switch is not allowed.

Rated control supply voltage Us				For MSPs	Screw Terminals	⊕	Weight approx.	Spring-type Terminals	⊕	Weight approx.
AC 50 Hz	AC 60 Hz	AC 50/60 Hz 100% ON period <sup>1</sup>	AC/DC 50/60 Hz, DC 5s ON period <sup>2</sup>	Size	Order No.		kg	Order No.		kg

### Auxiliary releases for motor starter protectors <sup>3</sup>

#### Undervoltage releases

415	480	—	—	S00 ... S3	<b>3RV29 02-1AV1</b>	0.117	—			
-----	-----	---	---	------------	----------------------	-------	---	--	--	--

#### Shunt releases

—	—	20...24	20...70	S00 ... S3	<b>3RV29 02-1DB0</b>	0.119	<b>3RV29 02-2DB0</b>	0.115		
—	—	90...110	70...190		<b>3RV29 02-1DF0</b>	0.119	<b>3RV29 02-2DF0</b>	0.115		

<sup>1</sup> The voltage range is valid for 100% (infinite) ON period. The response voltage lies at 0.9 of the lower limit of the voltage range.

<sup>2</sup> The voltage range is valid for 5s ON period at AC 50 Hz/60 Hz and DC. The response voltage lies at 0.85 of the lower limit of the voltage range.

<sup>3</sup> One auxiliary release can be mounted on the right per motor starter protector (does not apply to 3RV21 motor starter protectors with overload reset function).

### Auxillary switch blocks for snapping on the front for contactors

3RV29 28-1H

Note: UL 508 demands for "Combination Motor Controller Type E" 1" air gaps and 2" creepage distances at lineside. The following terminal blocks must be used in S3 MSP's 3RV10. The S2 MSP 3RV10 conforms with stipulated air gaps and creepage distances without terminal block. Terminal blocks are not required for use according to CSA. With size S0 these terminal blocks cannot be used in combination with 3-phase busbars 3RV19.5. This also applies to size S3 in combination with transverse auxiliary switches.

Installation guidelines for AC 400/500 V

The following distances from earthed components must be observed when installing combinations:

Motor starter protectors in combination with contactors			Distances from earthed or live parts		
MSP	Contactor	Rated operational voltage	Y mm	X2 <sup>4)</sup> mm	Z mm
3RV2. 1 with	3RT20 1	400/500 V	20	10	9
3RV2. 2 with	3RT20 1	400/500 V	30	10	9
	3RT2. 2	400/500 V	30	10	9
	3RT2. 3	400/500 V	30	10	9
3RV2. 3 with	3RT20 2	400/500 V	50	10	10
	3RT2. 3	400/500 V	50	10	10
	3RT20 4	400/500 V	50	10	10
3RV2. 4 with	3RT20 4	400 V	90	10	12
	3RT20 4	500 V	220	10	20

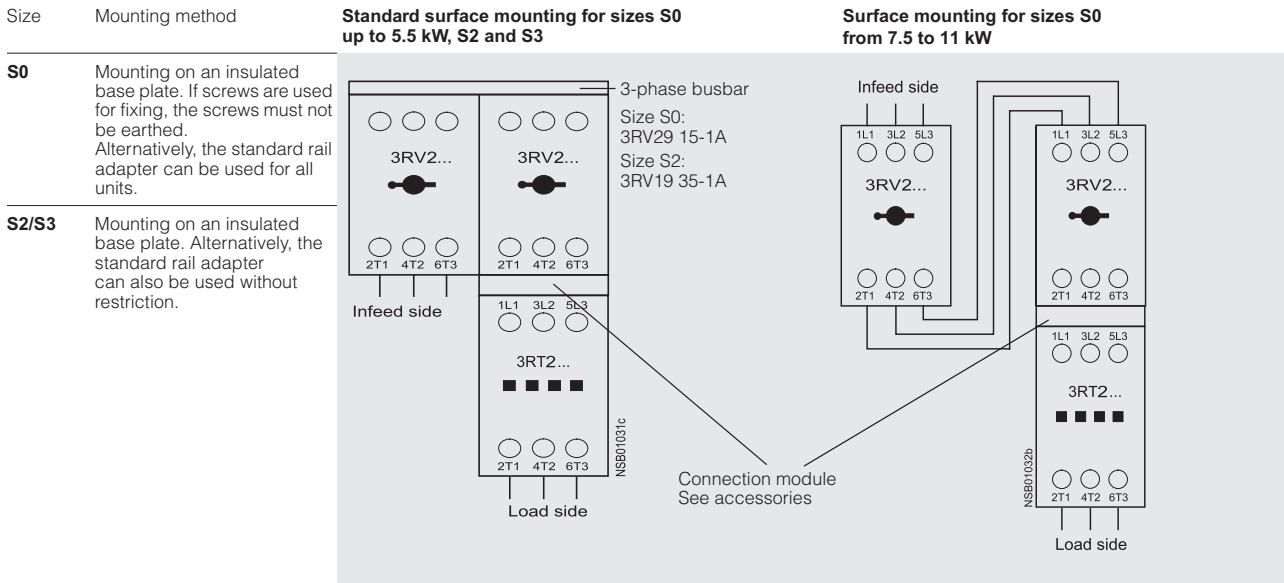

- No upstream circuit-breaker required; short-circuit proof up to 100 kA.

- Rated control supply voltage 120 V AC. Other voltages are possible.
- With these combinations, the distance between the subsequent MSP and the contactor must be at least 10 cm.
- Selection depends on the specific startup and rated data of the protected motor.
- Minimum distance to contactor at front. For the MSP, no minimum distance at the front must be maintained.

3RA2 – up to 100 A

1) Cable-lug and busbar connection possible after removing the box terminals.

2) If two different conductor cross-sections are connected to one clamping point, both cross-sections must lie in the range specified. If identical cross-sections are used, this restriction does not apply.

3RA2 – up to 100 A

**Overview**

The 3RA combination starters consist of the 3RV MSP and the 3RT contactor. MSP and contactor are prewired and mechanically connected with preassembled kits (link modules, connection assembly kits and mounting rail or busbar adapters).

As the 3RA combination starters are constructed from 3RV MSPs and 3RT contactors, the same accessories can be used for the combination starter as for these MSPs and contactors.

Pre-assembled link modules are available as accessories for the power spectrum up to 75 HP. The desired combination starter can thus be assembled quickly and economically by the customer. A time saving is also achieved with the link modules as – unlike with conventional wiring systems – there is no need to rectify possible wiring errors.

As a combination starter rated for tap conductor protection for group installation the 3RV MSP is responsible for overload and short-circuit protection in the motor circuit. Back-up protective devices, such as fuses or SIEMENS Sentron circuit breakers are required as per NEC 430-53 guidelines for group installations for multiple motor applications

The 3RT contactor is ideal for extremely complex switching tasks requiring durable components.

The permissible ambient temperature is 60 °C with butt-mounting and without derating (70 °C possible subject to certain restrictions).

3RA combination starters are available for motors up to 75 Hp at 460 V AC and setting ranges from 0.14 A to 100 A.

3RA combination starters are supplied in four different sizes:

Size	Overall width mm	Max. rated current $I_{n\ max}$ A	For three-phase motors up to HP
S00	45	8	5
S0	45	22	15
S2	55	50	40
S3	70	100	75

**Operating conditions**

3RA combination starters are climate-proof. They are intended for use in enclosed rooms in which no severe conditions (such as dust, caustic vapors, hazardous gases) prevail. Suitable enclosures must be provided for installation in dusty and damp locations.

**Accessories**

The accessories for the special equipment, such as auxiliary contacts and undervoltage trips, can also be used for the 3RA combination starters.

In addition, certain accessories have been optimized for the combination starters. They include the top-connected, transverse auxiliary contact on the MSP with one changeover contact or one NO contact + one NC contact. Special auxiliary contact blocks that can be snapped on from below are available for the contactor.

These two accessories enable the combination starters to be wired easily without having to route cables via the equipment.

The special accessories for 3RA combination starters take the form of link modules for 3RV MSPs and 3RT contactors.

**Technical data**

For technical data, see pages 4/56-4/58. Additional details are contained in the respective tables for the 3RV MSPs and 3RT contactors.

**Configuration**

**Overload tripping times**

All the 3RA combination starters described here are designed for normal starting, in other words for overload tripping times of less than 10 s (CLASS 10). At rated-load operating temperature the tripping times are shorter, depending on the particular equipment and the setting range. The exact values can be derived from the tripping characteristics of the MSPs.

**Classification types**

DIN VDE 0660 Part 102 and IEC 60 947-4-1 make a distinction between two different types of coordination (types 1 and 2). Any short-circuits that occur are cleared safely by both types of coordination. The only differences concern the extent of the damage caused to the equipment by a short-circuit.

**IEC Type of coordination 1**

The combination starter may be non-operational after a short-circuit has been cleared. Damage to the contactor or to the overload relay is permissible. In 3RA load feeders, the MSP itself always achieves type of coordination 2.

**IEC Type of coordination 2**

There must be no damage to the overload trip or to any other components after a short-circuit has been cleared. The 3RA combination starter can resume operation without needing to be renewed. At most, it is permissible to weld the contactor contacts if they can be disconnected easily without any significant deformation.

**Mounting**

**Complete equipment**

The 3RA combination starters can be ordered as complete equipment for direct starting or for reversing mode. Control supply voltages of 50 Hz AC 230 V or DC 24 V and assembly on a 35 mm standard mounting rail or in a 40 or 60 mm busbar system are possible.

Special equipment for customer assembly can be ordered if other rated control supply voltages are required. The link modules simplify customer assembly of the load feeders.

The corresponding distances from earthed or live parts, as detailed in the technical data, must be observed.

**Customer assembly**

The standard devices can be combined optimally in terms of both technical data and dimensions, thanks to the modular system of the SIRIUS series.

The combination starters can thus be assembled easily by the customer. It is simply necessary to assemble the standard 3RV MSP and 3RT contactor and the appropriate link module together.

For the order numbers for special equipment and link modules, see the selection and ordering data.

For the link modules for direct starting or reversing mode and assembly on a standard mounting rail or busbar, see accessories.

If a MSP with a rotary operating mechanism is required for the lower setting ranges up to 12 A, the S0 MSP can also be assembled with an S00 contactor. A special connecting module is available for this purpose.

For the installation of feeders, it is imperative to use standard rail adapters, as from size S2 for direct starting and as from size S0 for reversing, to ensure the necessary mechanical strength. A standard rail adapter is not necessary if a busbar adapter is used.

**Assembly**

3RA combination starters are available for assembly on standard mounting rails in accordance with EN 50 022-35 x 15 or on busbar adapters with a busbar centre-line spacing of 40 or 60 mm and a busbar thickness of 5 or 10 mm.

The combination starters are also suitable for screw fixing.

Size S00 and S0 can be screwed on with the aid of plug-in clips (see accessories on page 4/47).

 3RA29 23-2AA2 for S0

<sup>2)</sup>Additional 3RA29 11-1CA00 spacer for height compensation on AC contactors size S0 with spring-type terminals.

3RA22 motor starter for reversing duty and 60 mm standard mounting rail in size S00/S0 (the version with screw connection is shown in the picture)

- ① Upper wiring module
- ② Lower wiring module
- ③ 2 connecting clips
- ④ Mechanical interlock (can be removed if necessary)

3RA2 – up to 100 A

Mounting

Reversing duty · For 60 mm busbar systems · Size S2

**RS assembly kit for reversing duty for busbar mounting**

**3RA2933-1DB1**

Comprising:

- 1 Wiring kit for main and auxiliary circuits
- 1 busbar adapter and device holder
- 1 mechanical locking device
- 2 connecting pins for 2 contactors
- Fixing screws

- ① **Motor starter protector**  
Size S2  
Screw terminals
- ② **Link module**  
3RA2931-1AA00  
Screw terminals
- ③ **Busbar adapter 60 mm**  
8US1211-6MT10
- ⑤ **Contactor**  
Size S2  
Screw terminals

- Wiring kit**  
For screw terminals  
3RA2933-2AA1
- ④ Upper wiring module
  - ⑧ Lower wiring module
  - ⑦ 2 connecting pins
  - ⑥ Mechanical interlock  
3RA2934-2B

Load feeder for reversing duty and 60 mm busbar in size S2  
(the version with screw terminals is shown in the picture)

3RA2 – up to 100 A

Components for Fast Bus mounting

- ① Link module  
for AC: 3RA19 41-1A  
for DC: 3RA19 41-1B
- ② Mechanical interlock  
3RA19 24-2B

# Fast Bus Busbar Adapter System

## Introduction

### General

The Fast Bus Multi-Motor Control system is a 3-phase insulated busbar system and is ideal for space saving in panel designs. The system saves considerable line side wiring and space for multi-motor panels. It is also ideal for panels where several feeder breakers are used and will save significant wiring space and wiring labor. The system is also ideal for future expansion planning, when building control panels. SIRIUS 3RV/3RT starter combinations and Siemens circuit breakers are all adaptable to Fast Bus for convenient mounting and faster replacement times.

Fast Bus is ideal for industrial applications where system availability is important.

### How to Select Fast Bus

- 1) Determine the required load.
- 2) Select method to power Fastbus.
  - Main lug up to 800A using a single set of lugs or up to 1400A using a double set of lugs.
  - Circuit breakers, 15A to 500A

If load exceeds 500A, the CB must be separately panel mounted and fed to a main lug infeed module.
- 3) Select 3RV MSP & 3RT contactor components and appropriate adapter shoe or select preassembled 3RA starters. See section 4.
- 4) Select appropriate length busbar, busbar holders, insulation covers and any other required components.

### Features

- Simple economical installation
- Compact design
- Requires fewer mounting holes
- Domestic and International approvals
- Touch safe
- Modular design
- Provision for system expansion
- Clip-on shoes provide mechanical and electrical connections to panel mounted busbars
- Main and Feeder breakers mount to busbars

### Benefits

- Saves installation time
- Reduces space requirements
- Minimizes layout time
- Allows flexibility for domestic and export business
- Protection for maintenance personnel
- Improves equipment mounting density
- Reduces time and costs associated with system expansion
- Reduces mounting and wiring time and provides trouble free connections
- Allows for quick retrofitting of breakers

### General Ratings of Fastbus System

	IEC	Domestic
Rated operating voltage	690V	600V
Rated insulation voltage, IEC VDE	AC 1000V	N/A
Temperature stability	Up to 105 degrees C	N/A
Busbar support and adapter shoe material	Glass-reinforced polyamide	Same
Color	RAL 7035, light gray	Same

### Ampacity

#### Busbar thickness and width

5 x 20 mm	3/16" x 3/4"	362A
5 x 25 mm	3/16" x 1"	432A
5 x 30 mm	3/16" x 1 1/8"	500A
10 x 20 mm	3/8" x 3/4"	564A
10 x 25 mm	3/8" x 1"	660A
10 x 30 mm	3/8" x 1 1/8"	756A
720mm <sup>2</sup>	---	1400A

For technical information on E and F frame circuit breakers used as main and feeder breakers, see section 17

*Thermal busbar currents, E-Cu, bare, at 35 °C ambient temperature in accordance with DIN 43 6711*

Busbar dimensions	System mm	Thermal current at Busbar temperature		
		65 °C A	85 °C A	105 °C A
20 x 5	60	274	362	430
25 x 5	60	327	432	513
30 x 5	60	379	500	595
20 x 10	60	427	564	670
30 x 10	60	573	756	900

### Fast Bus set-up

The Fast Bus system is designed to be easy to use and to save set up time.

#### 8US Busbar holders

The 8US busbar holders are designed to accommodate ampacities up to 1400A. In some cases, the busbar holder will accept busbars in either 5mm or 10mm widths. Refer to page 5/6 for selection details.

#### High quality material

Busbar supports and fuse bases are manufactured from glass-fiber reinforced, thermoplastic polyester with the color RAL 7035, light gray. The material ensures excellent mechanical, chemical and electrical properties. Furthermore, the material has an extremely low flammability and meets the requirements of UL 94 V0.

#### 8WC Busbar and busbar systems

The most common size busbar for applications in the US is the 8WC5053 (20 mm x 5 mm), however there are other styles available depending on your application.

Busbar systems with 60 mm busbar center-to-center clearance have now become firmly established in the US market.

The permissible busbar temperature is a decisive factor when dimensioning the busbars. The busbar temperature is dependent on the current, the current distribution, the busbar cross-section, the busbar surface, the position of the busbar, the convection and the ambient temperature. The values stated in the table on page 5/3 can only be considered as reference values because the conditions vary with each location. The values are based on constant current over the whole busbar length.

The trend toward busbars proves most advantageous when the incoming supply is centrally located and the load is distributed symmetrically on both sides.

For the assemblies of a busbar system in the feeder circuit the UL directives specify components with large clearance in air and creepage distances (see the table below). Components of the 8US1 busbar system which meet this requirement can be found in this chapter.

#### Note:

*The design of an 8US1 busbar system for use in the feeder circuit always presumes the use of the UL base plate (8US19 22-2UA01) so that the clearance in air and creepage distance requirements are met.*

### Feeder/branch circuit according to UL 508A

The feeder circuit is that part of a circuit which comes in front of the last short circuit protection device (SCPD). The branch circuit is that part of the circuit which follows after the last short circuit protection device. When the 8US1 busbar system is used in a switchgear which must comply with UL directives, it is important to establish whether it is to be used in the feeder circuit or the branch circuit. Components used in the feeder circuit require larger clearance in air and creepage distances than in the branch circuit.

#### Simple Fast Bus system

The two illustrations above show the very basic items needed when setting up a Fastbus system.

- ① 8US1 Busbar holder (5/6)
- ② 8US1 Ground busbar support (shown attached however can be mounted separately 5/6)
- ③ Ground busbar available in 5 x 20 mm to 10 x 30 mm
- ④ 8WC Busbar (8WC5053 shown) FBB36 Busbar (5/6)

### Short-circuit strength

The short-circuit strength of the busbar system is dependent on the spacing of the busbar holders and on the busbar cross-section.

The short-circuit strength of the whole system is dependent on the short-circuit strength of the busbar system and the components that are mounted to the system.

### Applications

The 8US Fast Bus distribution system is ideal for control panel builders with multiple motor applications. These applications are most common in the material handling, automotive, food processing, pharmaceutical and paper processing industries.

	Clearance in air	Creepage distance
Between live parts	25.4 mm (1 inch)	50.8 mm (2 inch)
Between live parts and grounded, non-insulated metal parts	25.4 mm (1 inch)	25.4 mm (1 inch)

# Fast Bus Busbar Adapter System

## Introduction

### Fast Bus combination starters and group installation assemblies

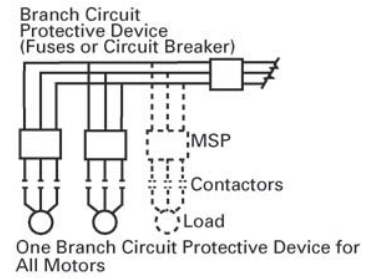

#### Ratings for Group Installations per NEC 430-53

Group Installation is an approach to building multiple motor control systems in accordance with Section 430-53 of the National Electrical Code. In Group installation, multiple motor starters can be grouped under one short circuit protective device. The 3RV MSPs have been UL listed for use in Group Installations both with and without 3RT contactors when mounted on the Fast Bus system. A 3RT contactor is added when remote operation of the motor is required.

#### Standard Installation, NEC 430-52

#### Group Installation, NEC 430-53

MSP Type	FLA Amp Range	FLA Amp Range	Maximum rating of Group Branch Circuit Protective Device		Short Circuit Current Ratings <sup>1) 2)</sup>		
			Fuse	Circuit Breaker	240V	480V	600V
3RV201	S00	0.11-12.5	The main fuse should be selected based on the FUSE selection procedure listed below.	The main CB should be selected based on the CIRCUIT BREAKER selection procedure listed below.	65kA	—	30kA
3RV201	S00	0.11-16			65kA	65kA	—
3RV202	S0	3.5-12.5			65kA	—	30kA
3RV202	S0	3.5-25			65kA	65kA	—
3RV202	S0	28-32			65kA	50kA	—
3RV202	S0	36-40			65kA	12kA	—
3RV203	S2	11-50			65kA	65kA	25kA
3RV204	S3	28-100			65kA	65kA	30kA

#### The selection of components for Group Installation is a simple process of the following three steps:

1. Selection of the Branch Circuit Protective Device, fuse or circuit breaker.
2. Selection of the 3RA Motor Starter based on the motor Full Load Amps.

#### Circuit Breaker Selection

Select a circuit breaker (CB) between:  
 Minimum CB size (per NEC430-110):  
 Sum of all motor FLC (per NEC table 430-150) x 115%.  
 Maximum CB size (per NEC430-53c):  
 250% x FLC of the largest motor + FLC of all other motors.

#### Fuse Selection

Calculate the maximum fuse size per NEC430-53c.  
 Max Fuse Size = 175% x FLC of largest motor + FLC of all other motors (FLC's from NEC table 430-150).

Assembled Starter Type	Starter Frame Size	FLA Amp Range	Short Circuit Current Ratings (Type E) <sup>1)</sup>		
			240V	480Y/277V	600Y/347V
3RA201	S00	0.11-12.5	—	—	30kA
3RA201	S00	0.11-16	65kA	65kA	—
3RA202	S0	0.45-12.5	—	—	30kA
3RA202	S0	0.45-25	65kA	65kA	—
3RA202	S0	28-32	50kA	50kA	—
3RA203	S2	11-50	65kA	65kA	25kA
3RA204	S3	28-75	—	—	30kA
3RA204	S3	28-100	65kA	65kA	—

<sup>1)</sup> Branch Circuit Protective Device for 480V-Ratings: The appropriate BCPD need to be determined in accordance with the National Electrical Code, Article 430-53 and the application. The following devices are permitted:

Fuses: Classes RK1, RK5, J, G, T, CC or Circuit breakers: Listed Siemens type, with a marked short-circuit rating equal or larger than the available short-circuit current rating. These devices were tested for group installation use at the above levels without any upstream branch circuit device.

<sup>2)</sup> 3RA2 used as Manual Motor Controller; Branch Circuit Protective Device for 600V-Ratings: Max. Class J 50A

<sup>3)</sup> Starter sizes S00,S0 and S3 require additional type E line side terminal adaptors on the MSP for type F applications. See section 1 accessories

1) UL 508A labeled panels require the use of components that meet the creepage and air distances of 1" air clearance and 2" creepage distance. N/A = not applicable for given item.  
2) Current rating dependent on size of busbar used. Refer to busbar selection data.

# Fast Bus Busbar Adapter System

60 mm system – Circuit breaker assemblies and kits

## Selection and ordering data

Description

### FBCB Fast Bus circuit breakers

Offer a full range of feeder circuit breakers from 15A to 250A. All kits 125A and under are pre-assembled on 60 mm Fast Bus adaptor shoes and ready to place on the busbar. Circuit breakers

150A and higher are pre-packaged kits for fast user assembly and must be torqued down to the busbar prior to assembly. For VL breakers, adaptors are available for up to 500A breakers

(both main and feeder orientation). See page 5/8.

## SIRIUS 3RM1 Motor Starters

## Overview

## Overview

3RM12 motor starter with reversing functionality and electronic overload protection

SIRIUS 3RM1 motor starters are compact devices with a width of 22.5 mm, combining a large number of functions in a single enclosure. They consist of combinations of relay contacts, power semiconductors (hybrid technology), and a solid-state overload relay for operational switching of three-phase motors up to 3 HP (at 480 V).

Feature	Value
Rated current (wide setting range of the electronic overload release)	0.1 ... 0.5 A 0.4 ... 2.0 A 1.6 ... 7.0 A (UL=6.1A)
Rated operational voltage	48 ... 500 V
Rated frequency	50/60 Hz
Rated control supply voltage	24 V DC, 110 V DC, 110 ... 230 V AC
Trip class	CLASS 10A

The 3RM1 motor starters with overload protection with wide setting range are offered as 3RM10 direct-on-line starters and 3RM12 reversing starters and as versions with safety-related shutdown.

Characteristic	3RM10	3RM11	3RM12	3RM13
Direct-on-line starters	✓	✓	--	--
Reversing starters	--	--	✓	✓
Overload protection with wide setting range	✓	✓	✓	✓
ATEX certification overload protection	--	✓	--	✓
Safety-related shutdown up to SIL 3 / PLc	--	✓	--	✓

## Hybrid technology

The 3RM1 motor starters combine the benefits of semiconductor technology and relay technology. This combination is also known as hybrid technology. The hybrid technology in the motor starter is characterized by the following features:

- The inrush current is conducted briefly via the semiconductors.  
Advantage: protection of relay contacts, long service life due to low wear
- The continuous current is conducted via relay contacts.  
Advantage: lower heat losses compared with the semiconductor.
- Shutdown is implemented again via the semiconductor.  
Advantage: the contacts are only slightly exposed to arcs, and this results in a longer service life.

## Functional density/space savings

The 3RM1 motor starters combine the functions direct/reversing starting and overload protection and safety-related shutdown in a single device, without changing the 22.5mm width.

For simple applications (such as starting and reversing three-phase loads with overload protection), motor starter combinations of power contactors and a solid-state overload relay, for example, can be replaced by a single 3RM1 starter. The more functions are required, the more devices can be replaced. The footprint area required for each motor starter in the control cabinet is reduced by values of 64 to 82%.

In the case of assemblies and grouped starter units there are further advantages.

## Wiring overhead

By combining various functions in a single device, wiring overhead is reduced. The greater the number of starters, the greater the saving in wiring. Savings can be made in:

- mains wiring and space reduction with the use of the 3RM19 three phase infeed system
- wiring of the reversing contactor assembly thanks to the integrated design
- reduction of control cables for the coils in group applications with the 3ZY12 device connectors

These savings reduce the time required for the wiring itself, while at the same time reducing both the risk of wiring errors and the amount of testing required after control cabinets have been completed.

## Configuration and inventory

The wide setting range of the electronic overload release (up to 1:5) reduces the cost of inventory and the considerations involved in configuration where the actual motor current to be expected is concerned. Compared with protection equipment with thermal overload protection, only 3 versions are now required to cover a current range of 0.1 to 7 A with 3RM1, instead of 17 versions.

## Connection methods

The 3RM1 is available with screw terminal, push-in terminals or a combination of both..

Push-in terminals are a form of spring-type connection allowing fast wiring without tools for rigid conductors or conductors equipped with end sleeves.

Fine-stranded or stranded conductors with no end finishing are wired using a screwdriver (with a 3.0 x 0.5 mm blade).

As with other spring-type terminals, a screwdriver is also required to release the conductor. The same tool as above can be used for this purpose.

The advantages of the push-in terminals are found, as with all spring-type terminals, in speed of assembly and disassembly and vibration-proof connection. There is no need for the checking and tightening required with screw terminals.

 Screw terminals

 Spring-type terminals

The terminals are indicated in the corresponding tables by the symbols shown on blue backgrounds.

# SIRIUS 3RM1 Motor Starters

## General Data

### Safety-related shutdown/safety integration

Thanks to the redundant design of the main circuit and internal monitoring, safety-related shutdown in accordance with SIL 3 / PLe is possible by shutting down the control supply voltage with 3RM11 Failsafe and 3RM13 Failsafe motor starters. Additional safety relays are not required in the main circuit.

Combination of four SIRIUS 3RM1 Failsafe motor starters with SIRIUS 3SK1 safety relay to allow safety-related collective disconnection of connected motors

3RM1 motor starters are ideal for combining with the 3SK1 safety relay (see Chapter 13 "Safety Technology" → "SIRIUS 3SK1 Safety Relays"). They can be combined by means of:

- conventional wiring
- a special device connector

This makes it very simple to shut down connected motors collectively. The wiring, and ultimately the shutting down of the control supply voltage in Emergency Stop situations, is performed via the device connector. There is no further need for complex looping of the connecting cables.

### Feedback to the control system

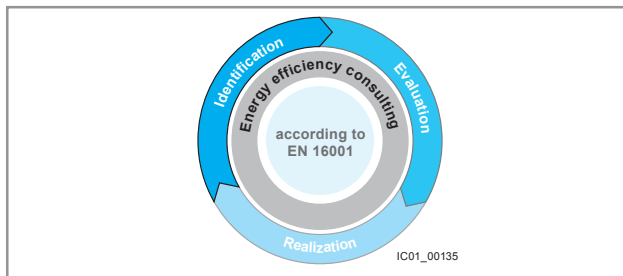

The electronic output in the 24 V DC control voltage version of the 3RM10 and 3RM12 motor starters allows the status of the connected motor to be reported to the higher-level control system. If the motor starter is controlled via inputs IN1 to 2, once the motor has been switched on and has started up correctly the output "OUT" is set.

### Infeed system for the main circuit

The 3RM19 infeed system available as an accessory for the main circuit with three-phase busbars allows fast, virtually error-free wiring of motor starters on the mains connection side and may reduce the number of short-circuit protective devices.

## Benefits

### Advantages through energy efficiency

Overview of the energy management process

We offer you a unique portfolio for efficient industrial energy management, using an energy management system that helps to optimally define your energy needs. We split up our industrial energy management into three phases – identify, evaluate, and realize – and we support you with the appropriate hardware and software solutions in every process phase.

The innovative products of the SIRIUS Industrial Controls portfolio can also make a substantial contribution to a plant's energy efficiency (see [www.siemens.com/sirius/energysaving](http://www.siemens.com/sirius/energysaving)).

With 3RM1 motor starters, control cabinets warm up less because power losses have been reduced by operation:

- Lower intrinsic power loss (than comparable motor starters with thermal overload trips) thanks to electronic current analysis
- Lower control circuit power losses (compared with conventional switching devices) as a result of electronic control of switching points
- Thanks to the above advantages, additional energy savings are possible because less cooling is required and a more compact design is possible

### Product advantages

The SIRIUS 3RM1 motor starters offer a number of benefits:

- Greater endurance and reduced heat losses thanks to hybrid technology
- Less space required in the control cabinet (64 to 82%) as a result of higher functional density
- Less wiring and testing required as a result of integrating several functions into a single device
- Lower costs for stock keeping and configuration as a result of the wide setting range of the electronic overload release (up to 1:5)
- Fast wiring without tools for rigid conductors or conductors equipped with end sleeves thanks to push-in spring-type connections
- Motor status feedback to the higher-level control system in the case of 3RM10 and 3RM12 motor starters in the 24 V DC version
- Virtually error-free wiring on the mains connection side and reduction in short-circuit protective devices by means of 3RM19 comb busbar and infeed system

# Hybrid Starters

3RM1 up to 3HP

### Selection and ordering data

- Direct and reversing starters in 22.5mm width
- Electronic overload protection — class 10
- Coil voltages 24VDC, 110-230VAC and 110VDC
- Screw Terminals or Spring Loaded Terminals
- Group Installation possible with fuse or UL489 breaker
- SCCR up to 100kA with J fuses
- Comb busbar accessories for easy group assembly
- Removeable terminals

### 3RM10 motor starter for direct-on-line starting with electronic overload protection

<http://www.usa.siemens.com/3RM1>

① Selection depends on motor full load amps.  
 Horsepower ratings are for reference only.

② Mixed terminal versions have spring loaded terminals for the control wiring and screw terminals on the mains.

This offers faster control wiring while still being able to use the 3RM19 comb busbar system on the mains.

For accessories, see page 6/6 and 6/8

For technical data, see page 6/9 and 6/10

For additional Compact Starters up to 25HP at 480V, see the 3RA6 series located in section 4

# SIRIUS 3RM1 Motor Starters

## Accessories

### Overview

#### Accessories for 3RM1 motor starters

The following accessories are available for the 3RM1 motor starter:

- 3-phase infeed system for the main circuit
- Device connectors for the control circuit
- Spare terminals for main and control circuits
  - With screw terminals
  - With push-in spring-type terminals
- Push-in lugs for wall mounting the motor starters
- Sealable cover as protection against unauthorized access

#### Three-phase infeed system (3RM19 three-phase busbar system)

Special three-phase busbar systems can be used to provide an easy, time-saving and safe means of feeding two or more 3RM1 motor starters with screw terminals.

These busbars are available in three lengths, thus allowing 2, 3 or 5 motor starters (arranged side-by-side) to be connected at the same time. More than 5 devices can be connected by clamping the connection tags of an additional busbar rotated by 180° (e.g. 6 devices using one 5-pole busbar and one 2-pole busbar).

A single motor starter can be removed from the assembly without loosening the terminal screws of neighboring motor starters.

The maximum summation current must not exceed 25 A. Primary infeed is connected via a three-phase infeed terminal.

The three-phase busbars are finger-safe but empty connection tags must be fitted with covers.

3RM19 infeed system with three-phase infeed terminal: In the above example, two three-phase busbars (5-pole busbars) rotated through 180° allow up to 9 3RM1 motor starters to be connected. Contact with the unused connection tags in unoccupied positions is prevented safely by the covers.

# SIRIUS 3RM1 Motor Starters

## Accessories

### Device connectors for the control circuit

The outlay for cabling between the devices is reduced using device connectors snapped onto a mounting rail, or screwed onto a level mounting panel (one device connector per motor starter).

#### Using the device connectors only for feeding in the control supply voltage

By using device connectors, several motor starters can be jointly supplied with a control supply voltage of 24 V DC. This requires the control supply voltage to be applied to the A1 and A2 terminals of only one motor starter.

Up to ten motor starters can be connected with device connectors. The 24 V DC control supply voltage must be within the operating range of 0.9 to 1.1 for this purpose. If the full operating range of 0.8 to 1.25 is to be used, no more than five motor starters can be used.

If the motor starters are not to be interconnected side-by-side, device daisy chain connectors must be used for the gaps.

When removing a motor starter, the corresponding device connector must be replaced by a device daisy chain connector if the control voltage is not to be interrupted for motor starters on the right.

The last motor starter in a row can be placed on a device termination connector. Flush termination of the configuration is thus possible.

#### Using device connectors in conjunction with 3SK1 safety relays

Interconnection of several Standard or Failsafe version motor starters into a group can also be used for joint disconnection by a 3SK1 safety relay.

To provide for the simultaneous and safe shutdown of several motor starters via a SIRIUS 3SK1 Safety Relay, you can simply interconnect the devices without additional wiring using a device connector.

The motors can then also be shut down safely according to SIL 3 / PLe with the motor starters.

Up to five motor starters can be operated on one safety relay with device connectors. If the motor starters are not to be interconnected side-by-side, device loop through connectors must be used for the gaps.

The last motor starter in a row must be placed on a device termination connector. This closes the circuits that were built up with the connectors.

For 3SK1 safety relays and associated device connectors see Chapter 13 "Safety Technology" → "SIRIUS 3SK1 Safety Relays"

Device connectors snapped onto a standard mounting rail to allow the joint connection of the control supply voltage for 3RM1 motor starters or connection to the 3SK1 safety relays

#### **Usage restrictions for accessories**

- The 3RM19 3-phase infeed system for the main circuit can only be used with 3RM1 motor starters with screw terminals.
- The device connectors are only suitable for 3RM1 motor starters with a control supply voltage of 24 V DC.

## Technical Data

## Application

3RM1 motor starters are designed for applications in which small motors have to be connected in the most confined spaces.

## Main areas of use

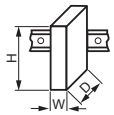

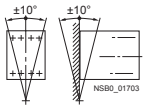

- Conveyor systems
- Logistics systems
- Production machines
- Machine tools
- Small elevators

## Standards and approvals

The motor starter complies with the following standards:

- IEC/EN 60947-4-2
- UL 508
- ATEX (available soon)
- IEC 61508-1: SIL 3 (available soon)
- ISO 13849: PLe (available soon)

3RW30

3RW40

3RW44

Class 73/74 Enclosed

Order No. Page

For operation in the control cabinet

3RW soft starters for standard applications

- Application areas
  - Fans
  - Building/construction machines
  - Escalators
  - Air conditioning systems
  - Assembly lines
  - Operating mechanisms
- Pumps
- Presses
- Transport systems
- Fans
- Compressors and coolers

3RW30 soft starters

- SIRIUS 3RW30 soft starters for soft starting and smooth ramp-down of three-phase asynchronous motors
- Performance range of up to 75 Hp (at 460 V)

3RW30 7/4

3RW40 soft starters

- SIRIUS 3RW40 soft starters with the integral functions
  - Solid-state motor overload and intrinsic device protection and
  - Adjustable current limiting
- Performance range of up to 300 Hp (at 460 V)

3RW40 7/8

3RW soft starters for high-feature applications

- Application areas
  - Pumps
  - Compressors
  - Industrial refrigerating systems
  - Conveying systems
  - Machine tools
- Fans
- Cooling systems
- Water transport
- Hydraulics
- Mills

3RW44 soft starters

- In addition to soft starting and soft ramp-down, the solid-state SIRIUS 3RW44 soft starters provide numerous functions for higher-level requirements
- Performance range
  - Up to 900 Hp (at 460 V) in inline circuit and
  - Up to 1600 Hp (at 460 V) in inside-delta circuit

3RW44 7/16

For enclosed applications

Enclosures in NEMA 1, 3, 4, & 12 types  
UL/CSA listed

- Complete starter includes 3RW40 or 3RW44 and CPT
- Performance Range of up to 600 Hp (at 460 V)
- Combination options include circuit breaker or fusible disconnect

Class 73/74 7/83

- Application areas:
  - Compressors
  - Pumps
  - Stamping presses
  - Cooling towers
  - Molding and extruding
  - Chippers and debarkers
- Lumber processing
- Pulp & paper processing
- Conveyors
- Textiles
- HVAC

# 3RW Soft Starters

## General Data

### Overview

The advantages of the SIRIUS soft starters at a glance:

- Soft starting and smooth ramp-down<sup>1)</sup>
- Stepless starting
- Reduction of current peaks
- Avoidance of mains voltage fluctuations during starting
- Reduced load on the power supply network

- Reduction of the mechanical load in the operating mechanism
- Considerable space savings and reduced wiring compared with conventional starters
- Maintenance-free switching
- Very easy handling
- Fits perfectly in the SIRIUS modular system

		SIRIUS 3RW30 Standard applications	SIRIUS 3RW40 Standard applications	SIRIUS 3RW44 High-Feature applications

# 3RW Soft Starters

## 3RW30 for standard applications

### Overview

The SIRIUS 3RW30 soft starters reduce the motor voltage through variable phase control and increase it in ramp-like mode from a selectable starting voltage up to mains voltage. During starting, these devices limit the torque as well as the current and prevent the shocks which arise during direct starts or wye-delta starts. In this way, mechanical loads and mains voltage dips can be reliably reduced.

Soft starting reduces the stress on the connected equipment and results in lower wear and therefore longer periods of trouble-free production. The selectable start value means that the soft starters can be adjusted individually to the requirements of the application in question and unlike wye-delta starters are not restricted to two-stage starting with fixed voltage ratios.<sup>1)</sup>

The SIRIUS 3RW30 soft starters are characterized above all by their small space requirements. Integrated bypass contacts mean that minimal power loss is used at the power semiconductors (thyristors) after the motor has started up. This cuts down on heat losses, enabling a more compact design and making external bypass circuits superfluous.

Various versions of the SIRIUS 3RW30 soft starters are available:

- Standard version for fixed-speed three-phase motors, sizes S00, S0, S2 and S3, with integrated bypass contact system
- Version for fixed-speed three-phase motors in a 22.5 mm enclosure without bypass

Soft starters rated up to 75 Hp (at 460 V) for standard applications in three-phase networks are available. Extremely small sizes, low power losses and simple start-up are just three of the many advantages of this soft starter.

<sup>1)</sup> Actual motor start times are load dependent.

### Application

The 3RW30 soft starters are suitable for soft starting of three-phase asynchronous motors.

Due to two-phase control, the current is kept at minimum values in all three phases throughout the entire starting time. Due to continuous voltage influencing, current and torque peaks, which are unavoidable in the case of wye-delta starters, for instance, do not occur.

#### Application areas

- Pumps
- Heat pumps
- Hydraulic pumps
- Presses
- Conveyors
- Roller conveyor
- Screw conveyors

3	0.55	<b>1.1</b>	--	2.6	0.5	<b>0.5</b>	--	--	22.5 mm	<b>3RW30 03-1CB54</b>	1 unit	0.207
										<b>3RW30 03-2CB54</b>	1 unit	0.188

1) Stand-alone installation.  
2) Power connection: screw terminals.

*Note:*  
Selection of the soft starter depends on the rated motor current.

The SIRIUS 3RW30 solid-state soft starters are designed for easy starting conditions.  $J_{Load} < 10 \times J_{Motor}$ . In the event of deviating conditions or increased switching frequency, it may be necessary to choose a larger device. Siemens recommends the use of the selection and simulation program Win-Soft Starter. For information about rated currents for ambient temperatures > 40 °C, see technical specifications (see technical information on page 7/44).

## 3RW30 for standard applications

### More information

#### Application examples for normal starting (Class 10)

**Normal starting Class 10** (up to 20 s with 300 %  $I_{n, motor}$ ).  
The soft starter rating can be selected to be as high as the rating of the motor used.

Application	Conveyor belt	Roller conveyor	Compressor	Small fan	Pump	Hydraulic pump
<b>Starting parameters</b>						
• Voltage ramp and current limiting						
- Starting voltage	% 70	60	50	40	40	40
- Starting time	s 10	10	20	20	10	10

**Note:**

These tables present sample set values and device sizes. They are intended only for the purposes of information and are not binding. The set values depend on the application in question and must be optimized during start-up. Actual start times are load dependent.

The soft starter dimensions should be checked where necessary with the Win-Soft Starter software or with the help of Technical Assistance.

#### Configuration

The 3RW solid-state motor controllers are designed for easy starting conditions. In the event of deviating conditions or increased switching frequency, it may be necessary to choose a larger device. For accurate dimensioning, use the Win-Soft Starter selection and simulation program.

If necessary, an overload relay for heavy starting must be selected where long starting times are involved. PTC sensors are recommended.

In the motor feeder between the SIRIUS 3RW soft starter and the motor, no capacitive elements are permitted (e. g. no reactive-power compensation equipment). In addition, neither static systems for reactive-power compensation nor dynamic PFC (Power Factor Correction) must be operated in parallel during starting and ramp-down of the soft starter. This is important to prevent faults arising on the compensation equipment and/or the soft starter.

All elements of the main circuit (such as fuses, controls and overload relays) should be dimensioned for direct starting, following the local short-circuit conditions. Fuses, controls and overload relays must be ordered separately. Please observe the maximum switching frequencies specified in the technical specifications.

**Note:**

When induction motors are switched on, voltage drops normally appear on starters of all types (direct starters, wye-delta starters, soft starters). The infeed transformer must always be dimensioned such that the voltage dip when starting the motor remains within the permissible tolerance. If the infeed transformer is dimensioned with only a small margin, it is best for the control voltage to be supplied from a separate circuit (independently of the main voltage) in order to avoid the potential switching off of the soft starter.

#### Power electronics schematic circuit diagram

A bypass contact system is already integrated in the 3RW30 soft starter and therefore does not have to be ordered separately.

#### Status graphs

#### Win-Soft Starter selection and simulation program

With this software, you can simulate and select all Siemens soft starters, taking into account various parameters such as mains properties, motor and load data, and special application requirements.

The software is a valuable tool, which makes complicated, lengthy manual calculations for determining the required soft starters superfluous.

The Win-Soft Starter selection and simulation program can be downloaded from:

<http://www.siemens.de/sanftstarter> > Software

More information can be found on the Internet at:

<http://www.sea.siemens.com/softstarters>

# 3RW Soft Starters

## 3RW40 for standard applications

### Overview

SIRIUS 3RW40 soft starters have all the same advantages as the 3RW30 soft starters.

The SIRIUS 3RW40 soft starters are characterized above all by their small space requirements. Integrated bypass contacts mean that minimal power is used at the power semiconductors (thyristors) after the motor has started up. This cuts down on heat losses, enabling a more compact design and making external bypass circuits superfluous.

At the same time this soft starter comes with additional integrated functions such as adjustable current limiting, motor overload and intrinsic device protection, and optional thermistor motor protection on some models.

Internal intrinsic device protection prevents the thermal overloading of the thyristors and the power section defects this can cause. As an option the thyristors can also be protected by semiconductor fuses from short-circuiting.

Thanks to integrated status monitoring and fault monitoring, this compact soft starter offers many different diagnostics options. Up to four LEDs and relay outputs permit differentiated monitoring and diagnostics of the operating mechanism by indicating the operating state as well as for example mains or phase failure, missing load, non-permissible tripping time/class setting, thermal overloading or device faults.

Soft starters rated up to 300 Hp (at 460 V) for standard applications in three-phase systems are available. Extremely small sizes, low power losses and simple start-up are just three of the many advantages of the SIRIUS 3RW40 soft starters.

### **"Increased safety" type of protection EEx e according to ATEX directive 94/9/EC**

The 3RW40 soft starter sizes S0 to S12 are suitable for the starting of explosion-proof motors with "increased safety" type of protection EEx e.

See "Appendix" → "Standards and approvals" → "Type overview of approved devices for potentially explosive areas (ATEX explosion protection)".

### Application

The SIRIUS 3RW40 solid-state soft starters are suitable for soft starting and stopping of three-phase asynchronous motors.

Due to two-phase control, the current is kept at minimum values in all three phases throughout the entire starting time and disturbing direct current components are eliminated in addition. This not only enables the two-phase starting of motors up to 300 Hp (at 460 V) but also avoids the current and torque peaks which occur e. g. with wye-delta starters.

### Application areas

- Pumps
- Heat pumps
- Hydraulic pumps
- Presses
- Conveyors
- Roller conveyor
- Screw conveyors
- Escalators
- Small fans
- Centrifugal blowers
- Bow thrusters
- Stirrers
- Extruders

## 3RW40 for standard applications

### More information

#### Application examples for normal starting (Class 10)

**Normal starting Class 10** (up to 20 s with 350 %  $I_{n\ motor}$ ).

The soft starter rating can be selected to be as high as the rating of the motor used.

Application	Conveyor belt	Roller conveyor	Small fan	Pump	Hydraulic pump
<b>Starting parameters</b>					
• Voltage ramp and current limiting					
- Starting voltage	%	70	60	40	40
- Starting time	s	10	10	10	10
- Current limit value		$5 \times I_M$	$5 \times I_M$	$4 \times I_M$	$4 \times I_M$
<b>Ramp-down time</b>	s	5	5	0	10

#### Application examples for heavy starting (Class 20)

**Heavy starting Class 20** (up to 40 s with 350 %  $I_{n\ motor}$ ).

The soft starter has to be selected at least one rating class higher than the motor used.

Application	Stirrer	Centrifuge
<b>Starting parameters</b>		
• Voltage ramp and current limiting		
- Starting voltage	%	40
- Starting time	s	20
- Current limit value		$4 \times I_M$
<b>Ramp-down time</b>	s	0

Note:

These tables present sample set values and device sizes. They are intended only for the purposes of information and are not binding. The set values depend on the application in question and must be optimized during start-up. Actual start times are load dependent.

The soft starter dimensions should be checked where necessary with the Win-Soft Starter software or with the help of Technical Assistance.

# 3RW Soft Starters

## 3RW40 for standard applications

### Configuration

The 3RW solid-state soft starters are designed for easy starting conditions. In the event of severe conditions or increased switching frequency, it may be necessary to choose a larger device. For accurate dimensioning, use the Win-Soft Starter selection and simulation program.

Where long starting times are involved, the integrated solid-state overload relay for heavy starting should not be disconnected. PTC sensors are recommended. This also applies for the smooth ramp-down because during the ramp-down time an additional current loading applies in contrast to free ramp-down.

In the case of high switching frequencies in S4 mode, Siemens recommends the use of PTC sensors. For corresponding device versions with integrated thermistor motor protection or separate thermistor evaluation devices see Industrial Controls catalog Chapter 11 "Function Relays, Interfaces and Converters".

In the motor feeder between the SIRIUS 3RW soft starter and the motor, no capacitive elements are permitted (e. g. no reactive-power compensation equipment, PFC capacitors). In addition, neither static systems for reactive-power compensation nor dynamic PFC (Power Factor Correction) must be operated in parallel during starting and ramp-down of the soft starter. This is important to prevent faults arising on the compensation equipment and/or the soft starter.

All elements of the main circuit (such as fuses and controls) should be dimensioned for direct starting, following the local short-circuit conditions. Fuses, controls and overload relays must be ordered separately. Please observe the maximum switching frequencies specified in the technical specifications.

**Note:**

*When induction motors are switched on, voltage drops normally appear on starters of all types (direct starters, wye-delta starters, soft starters). The infeed transformer must always be dimensioned such that the voltage dip when starting the motor remains within the permissible tolerance. If the infeed transformer is dimensioned with only a small margin, it is best for the control voltage to be supplied from a separate circuit (independently of the main voltage) in order to avoid the potential switching off of the soft starter.*

### Power electronics schematic circuit diagram

A bypass contact system and solid-state overload relay are already integrated in the 3RW40 soft starter and therefore do not have to be ordered separately.

- 1)  $U_n$  = Full Voltage
- 2)  $U_s$  = Starting (Initial) Voltage
- 3)  $t_{R}$  = Time Running
- 4)  $I_e$  = Rated operational current

### Status graphs<sup>1)</sup>

### Win-Soft Starter selection and simulation program

With this software, you can simulate and select all Siemens soft starters, taking into account various parameters such as mains properties, motor and load data, and special application requirements.

The software is a valuable tool, which makes complicated, lengthy manual calculations for determining the required soft starters superfluous.

The Win-Soft Starter selection and simulation program can be downloaded from:

[www.usa.siemens.com/softstarters](http://www.usa.siemens.com/softstarters) > Software

More information can be found on the Internet at:

[www.usa.siemens.com/softstarters](http://www.usa.siemens.com/softstarters)

# 3RW Soft Starters

## 3RW44 for high-feature applications

### Overview

In addition to soft starting and soft ramp-down, the solid-state SIRIUS 3RW44 soft starters provide numerous functions for higher-level requirements. They cover a performance range up to 900 Hp (at 460 V) in the inline circuit and up to 1600Hp (at 460 V) in the inside-delta circuit.

The SIRIUS 3RW44 soft starters are characterized by a compact design for space-saving and clearly arranged control cabinet layouts. For optimized motor starting and stopping the innovative SIRIUS 3RW44 soft starters are an attractive alternative with considerable savings potential compared to applications with a frequency converter. The new torque control and adjustable current limiting enable the High-Feature soft starters to be used in nearly every conceivable task. They guarantee the reliable avoidance of sudden torque applications and current peaks during motor starting and stopping. This creates savings potential when calculating the size of the switchgear and when servicing the machinery installed. Whether it's for inline circuits or inside-delta circuits – the SIRIUS 3RW44 soft starter offers savings especially in terms of size and equipment costs.

The bypass contacts already integrated in the soft starter bypass the thyristors after a motor ramp-up is detected. This results in a further reduction in the heat loss occurring during operation of the soft starter.

Combinations of various starting, operating and ramp-down possibilities ensure an optimum adaptation to the application-specific requirements. Operation and commissioning can be performed with the menu-controlled keypad and a menu-prompted, multi-line graphical display with background lighting. The optimized motor ramp-up and ramp-down can be effected quickly, easily and reliably by means of just a few settings with a previously selected language. Four-key operation and plain-text displays for each menu point guarantee full clarity at every moment of the parameterization and operation.

#### Applicable standards

- IEC 60947-4-2
- UL/CSA

#### Soft Starter ES parameterization software

Soft Starter ES software is used for the parameterization, monitoring and service diagnostics of SIRIUS 3RW44 High Feature soft starters.

### Application

The SIRIUS 3RW44 solid-state soft starters are suitable for the torque-controlled soft starting and smooth ramp-down as well as braking of three-phase asynchronous motors.

#### Application areas, e. g.

- Pumps
- Fans
- Compressors
- Water transport
- Conveying systems and lifts
- Hydraulics
- Machine tools
- Mills
- Saws
- Crushers
- Mixers
- Centrifuges
- Industrial cooling and refrigerating systems

4

<sup>1)</sup> Control by way of the internal 24 V DC supply and direct control by means of PLC possible.

<sup>2)</sup> For inside delta selection, see page 7/76.

### Note:

Soft starter selection depends on the rated motor current.

The 3RW44 solid-state soft starters are designed for normal starting (Class 10). (Inertia load of the overall operating mechanism  $J_{Load} < 10 \times J_{Motor}$ ; starting current 350 %  $\times I_e$  for 20 s similar load). For any other conditions of use, the devices should be selected using the Win-Soft Starter selection and simulation program. See Technical specifications for information about rated currents for ambient temperatures > 40 °C and switching frequency.

<b>Order No. supplement for connection types</b>								
• With spring-type terminals					2			
• With screw terminals					6			
<b>Order No. supplement for the rated control supply voltage <math>U_s</math><sup>1)</sup></b>								
• 115 V AC								
• 230 V AC								

1) Control by way of the internal 24 V DC supply and direct control by means of PLC possible.

2) For inside delta selection, see page 7/76.

**Note:**

Soft starter selection depends on the rated motor current.

The 3RW44 solid-state soft starters are designed for normal starting (Class 10). (Inertia load of the overall operating mechanism  $J_{Load} < 10 \times J_{Motor}$ ; starting current 350 %  $\times I_e$  for 20 s similar load). For any other conditions of use, the devices should be selected using the Win-Soft Starter selection and simulation program. See Technical specifications for information about rated currents for ambient temperatures > 40 °C and switching frequency.

Introduction

Overview

SIRIUS ES engineering software (E-SW)

The programs of the SIRIUS ES software family enable:

- Clearly arranged configuring of device functions and their parameters – online and offline
- Efficient diagnostics functions and display of the most important measured values
- Time savings through shorter startup times.

The SIRIUS ES programs such as Motor Starter ES, Soft Starter ES and SIMOCODE ES are available in three versions which differ in user-friendliness, scope of functions and price (for details see the descriptions of the individual products).

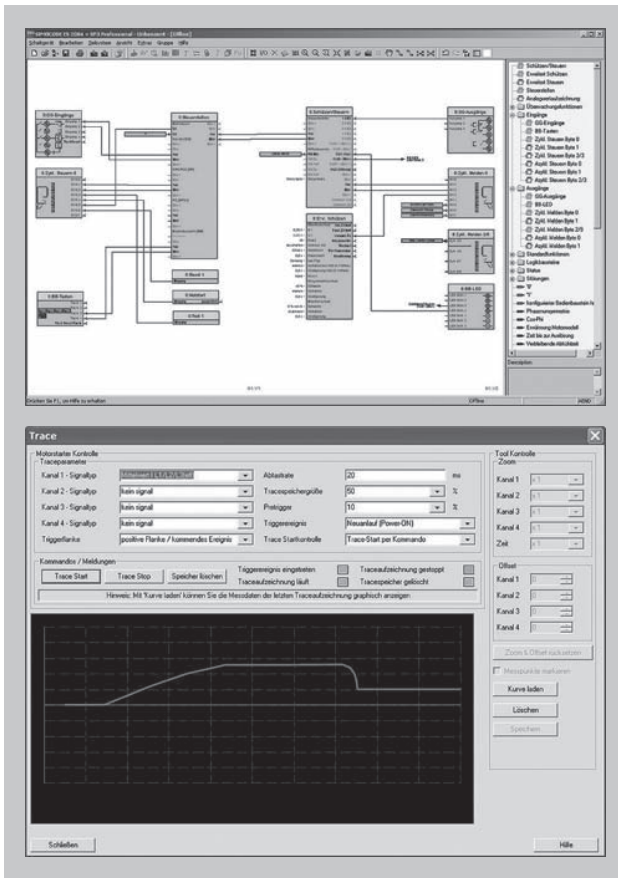

SIRIUS ES	Basic	Standard	Premium
Local interface on the device (system interface)	✓	✓	✓
Basic functions for parameterizing the devices			
• Parameter assignment	✓	✓	✓
• Operating	✓	✓	✓
• Diagnostics	✓	✓	✓
• Test	✓	✓	✓
Standard functionality			
• Parameterizing with the integrated graphics editor <sup>1)</sup>	--	✓	✓
• Creating typicals	--	✓	✓
• Exporting parameters	--	✓	✓
Complete functionality			
• Group functions	--	--	✓
• S7 Routing	--	--	✓
• Teleservice through MPI	--	--	✓
• STEP7 Object Manager	--	--	✓
• PROFIBUS interface	--	--	✓

<sup>1)</sup> Depending on SIRIUS ES program.

Application

In addition to device-specific parameterization, the programs of the SIRIUS ES software family also provide the following functionality in a uniform look and feel. These functions are available in many SIRIUS ES programs.

- Standards-conform printouts  
The programs of the SIRIUS ES software family greatly simplify machine documentation. Parameterization printouts according to EN ISO 7200 are possible. The elements to be printed are easy to select and compile as required.
- Easy creation of parameter templates  
Parameter templates can be created for devices and applications with only minimum differences in their parameters. These templates contain all the parameters which are needed for the parameterization. In addition it is possible to specify which of these parameters are fixed and which can be customized, e. g. by the startup engineer.
- Group function  
For the user-friendly parameterization of numerous devices or applications of the same type, the programs of the SIRIUS ES software family offer a group function which enables the parameterization of several devices to be read out or written through PROFIBUS. In conjunction with templates it is even possible to selectively adapt the same parameters in any number of parameterizations.
- Teleservice through MPI  
The premium versions of the SIRIUS ES software families support the use of MPI Teleservice (comprising the Teleservice software and various Teleservice adapters) for remote diagnostics of the devices. This facilitates diagnostics and maintenance and it shortens response times for service purposes.

Efficient engineering and startup with graphic interfaces and diagnostics options

**Types of delivery and license**

The programs of the SIRIUS ES software family are available as follows:

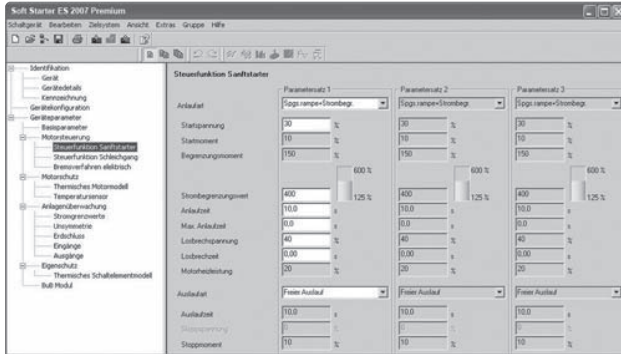

- Floating license – the license for any one user at any one time
  - Authorizes any one user
  - Independent of the number of installations (unlike the single license which is allowed to be installed once only)
  - Only the actual use of the program has to be licensed
  - Trial license (free use of all program functions for 14 days for test and evaluation purposes, included on every product CD, available in the download file of the SIRIUS ES program in the Service&Support portal).

Following delivery versions are available in addition for the programs of the SIRIUS ES software family:

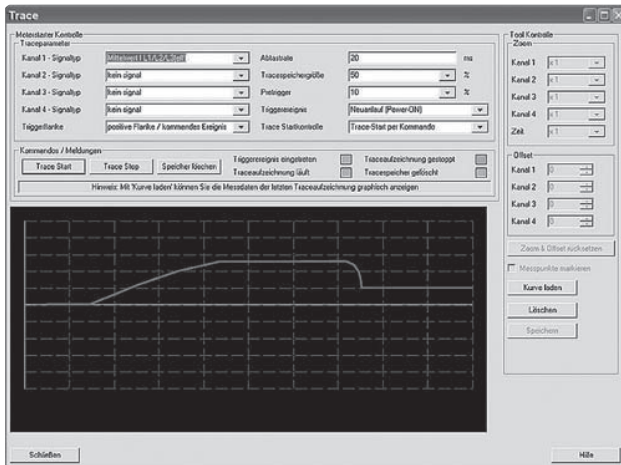

- Upgrade
  - Upgrade from an old to a new version with expanded functions, e. g. upgrade from Motor Starter ES 2006 to Motor Starter ES 2007
- Powerpack
  - Special pack for switching within the same software version to a more powerful version with more functionality, e. g. Powerpack Motor Starter ES 2007 for switching from Standard to Premium
- Software Update Service
  - To keep you up to date at all times we offer a special service which supplies you automatically with all service packs and upgrades

Soft Starter ES

Overview

Easy and clearly arranged parameter setting of the 3RW44 soft starter with Soft Starter ES 2007

Graphic presentation of measured values with the trace function (oscilloscope function) of Soft Starter ES 2007 Standard and Premium

Soft Starter ES 2007

The Soft Starter ES software permits the quick and easy parameterization, monitoring and diagnostics of SIRIUS 3RW44 High Feature soft starters for service purposes. The device parameters can be configured directly on the PC and transferred to the soft starter through a serial cable or an optional PROFIBUS interface.

The advantages of Soft Starter ES:

- Clearly arranged configuring of device functions and their parameters – online and offline
- Effective diagnostics functions on the soft starter and display of the most important measured values
- Trace function (oscilloscope function) for recording measured values and events (in the Soft Starter ES Standard and Premium software versions).

Efficient engineering with new program versions

The Soft Starter ES software program is available in three versions which differ in their user-friendliness, scope of functions and price.

Soft starters ES	Basic	Standard	Premium
Access through the local interface on the device	✓	✓	✓

<sup>1)</sup> Templates with Service Pack 1 and higher.

More functions

- Standards-conform printouts  
The software tool greatly simplifies machine documentation. Parameterization printouts according to EN ISO 7200 are possible. The elements to be printed are easy to select and compile as required.
- Easy creation of parameter templates  
Parameter templates can be created for devices and applications with only minimum differences in their parameters. These templates contain all the parameters which are needed for the parameterization. In addition it is possible to specify which of these parameters are fixed and which can be adapted, e. g. by the startup engineer.
- Group function  
For the user-friendly parameterization of numerous devices or applications of the same type, the programs of the SIRIUS ES software family offer a group function which enables the parameterization of several devices to be read out or written through PROFIBUS. In conjunction with typical it is even possible to selectively adapt the same parameters in any number of parameterizations.
- Teleservice through MPI  
The Soft Starter ES Premium version supports the use of MPI Teleservice (comprising the Teleservice software and various Teleservice adapters) for remote diagnostics of the devices. This facilitates diagnostics and maintenance, and it shortens response times for service purposes.

Soft Starter ES

**Types of delivery and license**

Soft Starter ES is available as follows:

- Floating license – the license for any one user at any one time
  - Authorizes any one user
  - Independent of the number of installations (unlike the single license which is allowed to be installed once only)
  - Only the actual use of the program has to be licensed
  - Trial license (free use of all program functions for 14 days for test and evaluation purposes, included on every product CD, available in the download file of the SIRIUS ES program in the Service&Support portal).

Following delivery versions are available in addition for Soft Starter ES 2007:

- Upgrade  
Upgrade from an old to a new version with expanded functions, e. g. upgrade from Soft Starter ES 2006 to Soft Starter ES 2007

- Powerpack  
Special pack for switching within the same software version to a more powerful version with more functionality, e. g. Powerpack Soft Starter ES 2007 for switching from Standard to Premium
- Software Update Service  
To keep you up to date at all times we offer a special service which supplies you automatically with all service packs and upgrades

**New licensing procedure**

To make licensing easier, the three versions of Soft Starter ES are available with immediate effect with the following license:

14 day trial license for Premium functions: for test and evaluation purposes, included on every product CD, available also in the download file of the SIRIUS Soft Starter ES 2007 program at [www.sea.siemens.com/softstarters](http://www.sea.siemens.com/softstarters).

**System requirements**

Soft Starter ES 2007 parameterization, start-up and diagnostics software for the SIRIUS 3RW44 soft starter	Basic/Standard	Premium
	Firmware version ≥ *E04* <sup>1)</sup>	Firmware version ≥ *E06* <sup>2)</sup>
Operating system	Windows 2000 (Service Pack 3 or 4), Windows XP Professional (Service Pack 2), Windows Vista Ultimate 32/ Business 32 <sup>3)</sup>	
Processor	≥ Pentium 800 MHz/≥ 1 GHz (Windows Vista)

## 3RW44 for high-feature applications

### More information

#### Application examples for normal starting (Class 10)

**Normal starting Class 10** (up to 20 s with 350 %  $I_{n \text{ motor}}$ ).  
The soft starter rating can be selected to be as high as the rating of the motor used.

Application	Conveyor belt	Roller conveyor	Compressor	Small fan	Pump	Hydraulic pump
<b>Starting parameters<sup>1)</sup></b>						
• Voltage ramp and current limiting						
- Starting voltage	% 70	60	50	30	30	30
- Starting time	s 10	10	10	10	10	10
- Current limit value	Deactivated	Deactivated	4 × $I_M$	4 × $I_M$	Deactivated	Deactivated
• Torque ramp						
- Starting torque	60	50	40	20	10	10
- End torque	150	150	150	150	150	150
- Starting time	10	10	10	10	10	10
• Breakaway pulse	Deactivated (0 ms)	Deactivated (0 ms)	Deactivated (0 ms)	Deactivated (0 ms)	Deactivated (0 ms)	Deactivated (0 ms)
<b>Ramp-down mode</b>	Smooth ramp-down	Smooth ramp-down	Free ramp-down	Free ramp-down	Pump ramp-down	Free ramp-down

#### Application examples for heavy starting (Class 20)

**Heavy starting Class 20** (up to 40 s with 350 %  $I_{n \text{ motor}}$ ).  
The soft starter has to be selected one rating class higher than the motor used.

Application	Mixer	Centrifuge	Milling machine
<b>Starting parameters<sup>1)</sup></b>			
• Voltage ramp and current limiting			
- Starting voltage	% 30	30	30
- Starting time	s 30	30	30
- Current limit value	4 × $I_M$	4 × $I_M$	4 × $I_M$
• Torque ramp			
- Starting torque	30	30	30
- End torque	150	150	150
- Starting time	30	30	30
• Breakaway pulse	Deactivated (0 ms)	Deactivated (0 ms)	Deactivated (0 ms)
<b>Ramp-down mode</b>	Free ramp-down	Free ramp-down	Free ramp-down or DC braking

#### Application examples for very heavy starting (Class 30)

**Very heavy starting Class 30** (up to 60 s with 350 %  $I_{n \text{ motor}}$ ).  
The soft starter has to be selected two rating classes higher than the motor used.

Application	Large fan	Mill	Crushers	Circular saw/bandsaw
<b>Starting parameters<sup>1)</sup></b>				
• Voltage ramp and current limiting				
- Starting voltage	% 30	50	50	30
- Starting time	s 60	60	60	60
- Current limit value	4 × $I_M$	4 × $I_M$	4 × $I_M$	4 × $I_M$
• Torque ramp				
- Starting torque	20	50	50	20
- End torque	150	150	150	150
- Starting time	60	60	60	60
• Breakaway pulse	Deactivated (0 ms)	80 %, 300 ms	80 %, 300 ms	Deactivated (0 ms)
<b>Ramp-down mode</b>	Free ramp-down	Free ramp-down	Free ramp-down	Free ramp-down

**Note:**

These tables present sample set values and device sizes. They are intended only for the purposes of information and are not binding. The set values depend on the application in question and must be optimized during start-up. The soft starter dimensions should be checked where necessary with the Win-Soft Starter software or with the help of Technical Assistance.

<sup>1)</sup> Actual motor starting times are load dependent.

# 3RW Soft Starters

## 3RW44 for high-feature applications

### Circuit concept

The SIRIUS 3RW44 soft starters can be operated in two different types of circuit.

- **Inline circuit**  
The controls for isolating and protecting the motor are simply connected in series with the soft starter. The motor is connected to the soft starter with three cables.
- **Inside-delta circuit**  
The wiring is similar to that of wye-delta starters. The phases of the soft starter are connected in series with the individual motor windings. The soft starter then only has to carry the phase current, amounting to about 58 % of the rated motor current (conductor current).

Comparison of the types of circuit

Inline circuit:  
Rated current  $I_e$  corresponds to the rated motor current  $I_n$ , 3 cables to the motor

Inside-delta circuit:  
Rated current  $I_e$  corresponds to approx. 58 % of the rated motor current  $I_n$ , 6 cables to the motor (as with wye-delta starters)

### Which circuit?

Using the inline circuit involves the lowest wiring outlay. If the soft starter to motor connections are long, this circuit is preferable. With the inside-delta circuit there is double the wiring complexity but a smaller size of device can be used at the same rating. It is also recommended to use an isolating contactor in series with each motor winding.

Thanks to the choice of operating mode between the inline circuit and inside-delta circuit, it is always possible to select the most favorable solution.

The braking function is possible only in the inline circuit.

### Configuration

The 3RW44 solid-state soft starters are designed for normal starting. In case of heavy starting or increased starting frequency, a larger device must be selected.

For long starting times it is recommended to have a PTC sensor in the motor. This also applies for the ramp-down modes smooth ramp-down, pump ramp-down and DC braking, because during the ramp-down time in these modes, an additional current load applies in contrast to free ramp-down.

In the motor feeder between the SIRIUS 3RW soft starter and the motor, no capacitive elements are permitted (e. g. no reactive-power compensation equipment). In addition, neither static systems for reactive-power compensation nor dynamic PFC (Power Factor Correction) must be operated in parallel during starting and ramp-down of the soft starter. This is important to prevent faults arising on the compensation equipment and/or the soft starter.

All elements of the main circuit (such as fuses and controls) should be dimensioned for direct starting, following the local short-circuit conditions. Fuses, controls and overload relays must be ordered separately.

A bypass contact system and solid-state overload relay are already integrated in the 3RW44 soft starter and therefore do not have to be ordered separately.

The harmonic component load for starting currents must be taken into consideration for the selection of motor starter protector (selection of release).

#### Note:

*When induction motors are switched on, voltage drops normally appear on starters of all types (direct starters, wye-delta starters, soft starters). The infeed transformer must always be dimensioned such that the voltage dip when starting the motor remains within the permissible tolerance. If the infeed transformer is dimensioned with only a small margin, it is best for the control voltage to be supplied from a separate circuit (independently of the main voltage) in order to avoid the potential switching off of the soft starter.*

### Device interface, PROFIBUS DP communication module, Soft Starter ES parameterizing and operating software

The 3RW44 electronic soft starters have a PC interface for communicating with the Soft Starter ES software or for connecting the external display and operator module. If the optional PROFIBUS communication module is used, the 3RW44 soft starter can be integrated in the PROFIBUS network and communicate using the GSD file or Soft Starter ES Premium software.

# 3RW Soft Starters

## 3RW44 for high-feature applications

### **System Manual for SIRIUS 3RW44**

Besides containing all important information on configuring, commissioning and servicing, the manual also contains example circuits and the technical specifications for all devices. This manual can be downloaded off the internet.

### **Win-Soft Starter selection and simulation program**

With this software, you can simulate and select all Siemens soft starters, taking into account various parameters such as mains properties, motor and load data, and special application requirements.

The software is a valuable tool, which makes complicated, lengthy manual calculations for determining the required soft starters superfluous.

The Win-Soft Starter selection and simulation program can be downloaded free of charge from:

[www.usa.siemens.com/softstarters](http://www.usa.siemens.com/softstarters) > Software

More information can be found on the Internet at:

# 3RW Soft Starters

## Soft starters for enclosed applications

### Overview

The family of 3RW40 and 3RW44 softstarters are available in stand alone enclosed control designs for smooth starting and stopping of standard NEMA design B three phase inductive motors, thus eliminating physical stresses to the system and load while minimizing starting current. These pre-engineered enclosed designs offer convenience and flexibility in and UL/CSA certified offering. Enclosed styles are available in combination and non-combination configurations through 600HP and system voltages of 200V, 230V, 480V, and 600V.

The Class 73 offers either the 3RW40 or 3RW44 in a non-combination style offering. These non-combination styles come standard with a choice of Type 1, 3R, 12, 4 NEMA rated enclosure, a control transformer, Sirius softstarter with built-in overload and bypass, line side power terminal block, and a reset pushbutton. The enclosed offering can be powerfully matched with a wide variety of factory modified options such as pushbutton control, pilot lights, metering and other control options such as isolation contactors and emergency start bypass starters. 3RW44 enclosed styles are also available with optional through the door keypad and Profibus communication.

The Class 74 offering includes all of the features of the Class 73 in a combination style design. Standard options are either a circuit breaker or fusible disconnect providing short circuit protection and soft starting in one package.

### Application

The Class 73/74 product is a fully enclosed solid state reduced voltage starter designed for a wide variety of industrial applications. The enclosed softstarter offerings are ideal for new as well as existing applications where total motor controls is required.

Proper selection based on application data is made simple following these easy steps:

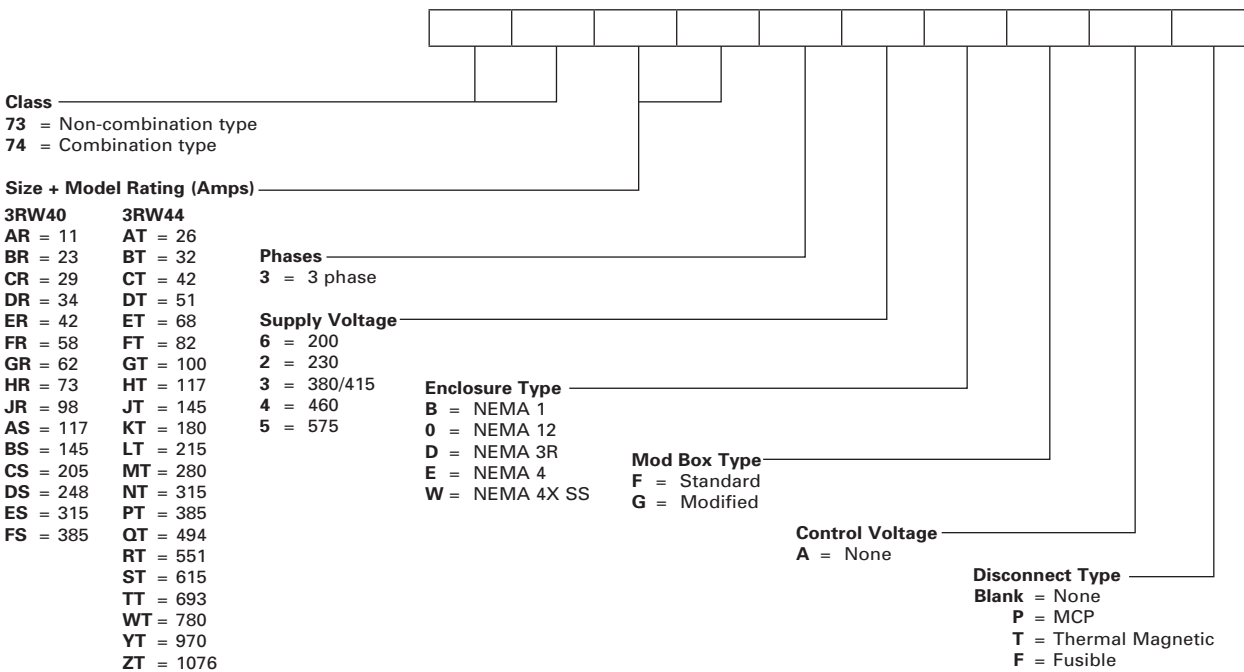

- Select proper RVSS by application
  - Select the 3RW40 versus the 3RW44 using the application info provided in the open section of the catalog
- Select the rating chart for normal starting or sever duty starting
  - Normal starting is rated at 350% of rated motor current IM for 10 seconds and based on starts per hour – representative of a class 20 application.
  - Severe starting is rated at 350% of rated motor current Im for 20 seconds and based on starts per hour – representative of a Class 20 application
- Select model using Motor nameplate data
  - Identify correct motor voltage column
  - Select rate current or HP row
  - Find ordering number under desired enclosure type column (e.g. NEMA 1)
  - Select appropriate system voltage
- Select factory modification on page 6/40<sup>1)</sup>

Example:  
3RW44, N12, CB disconnect, 460V, 200HP with a start/stop and red run light

Order No.  
74MT34BFAP A1 FC

## Product Nomenclature

### Class 73 and 74 Enclosed Soft Starters

<sup>1)</sup> Some modifications will require a larger 'Modified' box than the standard box e.g. Isolation contactor, space heater, etc. See page 7/43 for instructions.

# 3RW Soft Starters

## 3RW40 Size S0-S3 Non-Combo

**3RW40 Enclosed features:**

- Available in NEMA 1,12,3R,4, and 4 stainless steel
- Compact size
- Built-in Bypass contactor
- Voltage ramp up and ramp down
- Current limit adjustment of 125 - 550%
- Internal overload class 10,15,or 20
- Internal self protection
- Fault monitoring
- Isolation Contactor

### Ordering Information

- ▶ Enclosed devices should be ordered by the FLA of the motor.
- ▶ The 3RW40 is designed for normal starting applications.
- ▶ For factory modifications see page 7/43.
- ▶ For complete derating and application info see page 7/59
- ▶ For dimensional drawings see page 7/95.

Class 73 non-combination starters include:

- NEMA rated enclosure
- 3RW40 Sirius softstarter with built-in OL and bypass
- Control Circuit Transformer
- Line side power terminal block
- Reset button
- Isolation Contactor

Ideal applications for 3RW40 enclosed softstarters

- Fans
- Pumps
- Easy starting loads starting in less than 10 seconds

Class 73 starters are built to UL and CSA standards

## 3RW40 for Standard Applications

## Enclosed 3RW40

**3RW40 Enclosed features:**

- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
- Compact size
- Built-in bypass contactor
- Voltage ramp up and ramp down
- Current limit adjustment of 125 - 550%
- Internal overload class 10, 15, or 20
- Internal self protection
- Fault monitoring

### Ordering Information

- ▶ Enclosed devices should be ordered by the FLA of the motor.
- ▶ The 3RW40 is designed for normal starting applications (Class 10 applications).
- ▶ For factory modifications see page 7/43.
- ▶ For complete derating and application info see page 7/59.
- ▶ For dimensional drawings see page 7/95.

Class 73 non-combination starters include:

- NEMA rated enclosure
- 3RW40 Sirius softstarter with built-in OL and bypass
- Control circuit transformer
- Line side power terminal block
- Reset button

Ideal applications for 3RW40 enclosed softstarters:

- Fans
- Pumps
- Building/construction machines
- Presses
- Escalators
- Transport systems
- Air conditioning systems
- Ventilators
- Assembly lines

Class 73 starters are built to UL and CSA standards.

## 3RW40 – Size S0-S3 Circuit Breaker

**3RW40 Enclosed features:**

- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
- Compact size
- Built-in Bypass contactor
- Voltage ramp up and ramp down
- Current limit adjustment of 125 - 550%
- Internal overload class 10, 15, or 20
- Internal self protection
- Fault monitoring
- Isolation Contactor

### Ordering Information

- ▶ Enclosed devices should be ordered by the FLA of the motor.
- ▶ The 3RW40 is designed for normal starting applications.
- ▶ For factory modifications see page 7/43.
- ▶ For complete derating and application info see page 7/59
- ▶ For dimensional drawings see page 7/95.

Class 74 non-combination starters include:

- NEMA rated enclosure
- Circuit Breaker disconnect with shunt trip
- 3RW40 Sirius softstarter with built-in OL and bypass
- Control Circuit Transformer
- Isolation Contactor

Ideal applications for 3RW40 enclosed softstarters

- Fans
- Pumps
- Easy starting loads starting in less than 10 seconds

Class 74 starters are built to UL and CSA standards

Enclosed 3RW44

- 3RW40 Enclosed features:
- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
  - Compact size
  - Built-in bypass contactor
  - Voltage ramp up and ramp down
  - Current limit adjustment of 125 - 550%
  - Internal overload class 10, 15, or 20
  - Internal self protection
  - Fault monitoring

Ordering Information

- Enclosed devices should be ordered by the FLA of the motor.
- The 3RW40 is designed for normal starting applications (Class 10 applications).
- For factory modifications see page 7/43.
- For complete derating and application info see page 7/70.
- For dimensional drawings see page 7/95.

- Class 74 non-combination starters include:
- NEMA rated enclosure
  - Circuit breaker disconnect with shunt trip
  - 3RW40 Sirius softstarter with built-in OL and bypass
  - Control circuit transformer

Ideal applications for 3RW40 enclosed softstarters:

- Fans
- Pumps
- Building/construction machines
- Presses
- Escalators
- Transport systems
- Air conditioning systems
- Ventilators
- Assembly lines

Class 74 starters are built to UL and CSA standards.

① Starter size is dependent on the nameplate Full Load Amps (FLA) rating of the motor. HPs are for reference only. Enclosed ratings are at 40°C.

② Starter selection is dependent on type of application. Im = FLA rating of motor.

# 3RW Soft Starters

## 3RW40 – Size S0-S3 Fusible

- 3RW40 Enclosed features:
- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
  - Compact size
  - Built-in Bypass contactor
  - Voltage ramp up and ramp down
  - Current limit adjustment of 125 - 550%
  - Internal overload class 10,15, or 20
  - Internal self protection
  - Fault monitoring
  - Isolation Contactor

### Ordering Information

- ▶ Enclosed devices should be ordered by the FLA of the motor.
  - ▶ The 3RW40 is designed for normal starting applications.
  - ▶ For factory modifications see page 7/43.
  - ▶ For complete derating and application info see page 7/59
  - ▶ For dimensional drawings see page 7/95.
- Ideal applications for 3RW40 enclosed softstarters
- Fans
  - Pumps
  - Easy starting loads starting in less than 10 seconds
- Class 74 starters are built to UL and CSA standards

- Class 73 non-combination starters include:
- NEMA rated enclosure
  - Fusible Disconnect
  - 3RW40 Sirius softstarter with built-in OL and bypass
  - Control Circuit Transformer
  - Isolation Contactor

Enclosed 3RW44

- 3RW40 Enclosed features:
- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
  - Compact size
  - Built-in bypass contactor
  - Voltage ramp up and ramp down
  - Current limit adjustment of 125 - 550%
  - Internal overload class 10, 15, or 20
  - Internal self protection
  - Fault monitoring

Ordering Information

- Enclosed devices should be ordered by the FLA of the motor.
- The 3RW40 is designed for normal starting applications (Class 10 applications).
- For factory modifications see page 7/43.
- For complete derating and application info see page 7/70.
- For dimensional drawings see page 7/95.

Class 74 combination starters include:

- NEMA rated enclosure
- Fusible disconnect
- 3RW40 Sirius softstarter with built-in OL and bypass
- Control circuit transformer

Ideal applications for 3RW40 enclosed softstarters:

- Fans
- Pumps
- Building/construction machines
- Presses
- Escalators
- Transport systems
- Air conditioning systems
- Ventilators
- Assembly lines

Class 74 starters are built to UL and CSA standards.

For all technical information, please consult the 2006 Industrial Controls Catalog or contact your local sales support center.

Enclosed 3RW44

3RW44 Enclosed features:

- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
- Compact size
- Built-in bypass contactor
- Multiple starting/stopping techniques including torque control
- Internal overload class 5, 10, 15, 20, or 30
- Built-in graphical LCD keypad
- Internal self protection
- Fault monitoring
- 3 parameter sets
- Communication capable via opt. Profibus module
- Programmable inputs and outputs
- External keypad available

Ordering Information

- Enclosed devices should be ordered by the FLA of the motor.
- The 3RW44 is designed for normal starting applications.
- For factory modifications see page 7/43.
- For complete derating and application info see page 7/70.
- For dimensional drawings see page 7/95.

Class 73 non-combination starters include:

- NEMA rated enclosure
- 3RW44 Sirius softstarter with built-in OL and bypass
- Control circuit transformer
- Reset button

Ideal applications for 3RW44 enclosed softstarters:

- Fans
- Pumps
- Conveying systems and lifts
- Hydraulics
- Machine tools
- Mills saws
- Crushers and grinders
- Mixers
- HVAC systems

The 3RW44 severe duty rating table should be applied for high inertia applications such rock crushers, chippers, screw compressors, ect.

Class 73 starters are built to UL and CSA standards.

① Starter size is dependent on the nameplate Full Load Amps (FLA) rating of the motor. HPs are for reference only. Enclosed ratings are at 40°C.

② Starter selection is dependent on type of application. Im = FLA rating of motor.

Enclosed 3RW44

3RW44 Enclosed features:

- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
- Compact size
- Built-in bypass contactor
- Multiple starting/stopping techniques including torque control
- Internal overload class 10, 15, or 20
- Built-in graphical LCD keypad
- Internal self protection
- Fault monitoring
- 3 parameter sets
- Communication capable via opt. Profibus module
- Programmable inputs and outputs
- External keypad available

Ordering Information

- Enclosed devices should be ordered by the FLA of the motor.
- The 3RW44 is designed for normal starting applications.
- For factory modifications see page 7/43.
- For complete derating and application info see page 7/70.
- For dimensional drawings see page 7/95.

Class 73 non-combination starters include:

- NEMA rated enclosure
- 3RW44 Sirius softstarter with built-in OL and bypass
- Control circuit transformer
- Line side power terminal block
- Reset button

Ideal applications for 3RW44 enclosed softstarters:

- Fans
- Pumps
- Conveying systems and lifts
- Hydraulics
- Machine tools
- Mills saws
- Crushers and grinders
- Mixers
- HVAC systems

The 3RW44 severe duty rating table should be applied for high inertia applications such rock crushers, chippers, screw compressors, ect.

Class 73 starters are built to UL and CSA standards.

① Starter size is dependent on the nameplate Full Load Amps (FLA) rating of the motor. HPs are for reference only. Enclosed ratings are at 40°C.

② Starter selection is dependent on type of application. Im = FLA rating of motor.

Enclosed 3RW44

3RW44 Enclosed features:

- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
- Compact size
- Built-in bypass contactor
- Multiple starting/stopping techniques including torque control
- Internal overload class 5, 10, 15, 20, or 30
- Built-in graphical LCD keypad
- Internal self protection
- Fault monitoring
- 3 parameter sets
- Communication capable via opt. Profibus module
- Programmable inputs and outputs
- External keypad available

Ordering Information

- Enclosed devices should be ordered by the FLA of the motor.
- The 3RW44 is designed for normal starting applications.
- For factory modifications see page 7/43.
- For complete derating and application info see page 7/70.
- For dimensional drawings see page 7/95.
- For stocked versions see page 7/89.

Class 74 non-combination starters include:

- NEMA rated enclosure
- 3RW44 Sirius softstarter with built-in OL and bypass
- Circuit breaker with disconnect
- Control circuit transformer
- Reset button

Ideal applications for 3RW44 enclosed softstarters:

- Fans
- Pumps
- Conveying systems and lifts
- Hydraulics
- Machine tools
- Mills saws
- Crushers and grinders
- Mixers
- HVAC systems

The 3RW44 severe duty rating table should be applied for high inertia applications such rock crushers, chippers, screw compressors, ect.

Class 74 starters are built to UL and CSA standards.

① Starter size is dependent on the nameplate Full Load Amps (FLA) rating of the motor. HPs are for reference only. Enclosed ratings are at 40°C.

② Starter selection is dependent on type of application. Im = FLA rating of motor.

Enclosed 3RW44

3RW44 Enclosed features:

- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
- Compact size
- Built-in bypass contactor
- Multiple starting/stopping techniques including torque control
- Internal overload class 5, 10, 15, 20, or 30
- Built-in graphical LCD keypad
- Internal self protection
- Fault monitoring
- 3 parameter sets
- Communication capable via opt. Profibus module
- Programmable inputs and outputs
- External keypad available

Ordering Information

- Enclosed devices should be ordered by the FLA of the motor.
- The 3RW44 is designed for normal starting applications.
- For factory modifications see page 7/43.
- For complete derating and application info see page 7/70.
- For dimensional drawings see page 7/95.
- For stocked versions see page 7/89.

Class 74 non-combination starters include:

- NEMA rated enclosure
- 3RW44 Sirius softstarter with built-in OL and bypass
- Circuit breaker with disconnect
- Control circuit transformer
- Reset button

Ideal applications for 3RW44 enclosed softstarters:

- Fans
- Pumps
- Conveying systems and lifts
- Hydraulics
- Machine tools
- Mills saws
- Crushers and grinders
- Mixers
- HVAC systems

The 3RW44 severe duty rating table should be applied for high inertia applications such rock crushers, chippers, screw compressors, ect.

Class 74 starters are built to UL and CSA standards.

② Starter selection is dependent on type of application. Im = FLA rating of motor.

Enclosed 3RW44

3RW44 Enclosed features:

- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
- Compact size
- Built-in bypass contactor
- Multiple starting/stopping techniques including torque control
- Internal overload class 5, 10, 15, 20, or 30
- Built-in graphical LCD keypad
- Internal self protection
- Fault monitoring
- 3 parameter sets
- Communication capable via opt. Profibus module
- Programmable inputs and outputs
- External keypad available

Ordering Information

- Enclosed devices should be ordered by the FLA of the motor.
- The 3RW44 is designed for normal starting applications.
- For factory modifications see page 7/43.
- For complete derating and application info see page 7/70.
- For dimensional drawings see page 7/95.

Class 74 non-combination starters include:

- NEMA rated enclosure
- 3RW44 Sirius softstarter with built-in OL and bypass
- Fusible disconnect
- Control circuit transformer
- Reset button

Ideal applications for 3RW44 enclosed softstarters:

- Fans
- Pumps
- Conveying systems and lifts
- Hydraulics
- Machine tools
- Mills saws
- Crushers and grinders
- Mixers
- HVAC systems

The 3RW44 severe duty rating table should be applied for high inertia applications such rock crushers, chippers, screw compressors, ect.

Class 74 starters are built to UL and CSA standards.

For all technical information, please consult the 2006 Industrial Controls Catalog or contact your local sales support center.

① Starter size is dependent on the nameplate Full Load Amps (FLA) rating of the motor. HPs are for reference only. Enclosed ratings are at 40°C.

② Starter selection is dependent on type of application. Im = FLA rating of motor.

Enclosed 3RW44

3RW44 Enclosed features:

- Available in NEMA 1, 12, 3R, 4, and 4 stainless steel
- Compact size
- Built-in bypass contactor
- Multiple starting/stopping techniques including torque control
- Internal overload class 5, 10, 15, 20, or 30
- Built-in graphical LCD keypad
- Internal self protection
- Fault monitoring
- 3 parameter sets
- Communication capable via opt. Profibus module
- Programmable inputs and outputs
- External keypad available

Ordering Information

- ▶ Enclosed devices should be ordered by the FLA of the motor.
- ▶ The 3RW44 is designed for normal starting applications.
- ▶ For factory modifications see page 7/43.
- ▶ For complete derating and application info see page 7/70.
- ▶ For dimensional drawings see page 7/95.

Class 74 non-combination starters include:

- NEMA rated enclosure
- 3RW44 Sirius softstarter with built-in OL and bypass
- Fusible disconnect
- Control circuit transformer
- Reset button

Ideal applications for 3RW44 enclosed softstarters:

- Fans
- Pumps
- Conveying systems and lifts
- Hydraulics
- Machine tools
- Mills saws
- Crushers and grinders
- Mixers
- HVAC systems

The 3RW44 severe duty rating table should be applied for high inertia applications such rock crushers, chippers, screw compressors, ect.

Class 74 starters are built to UL and CSA standards.

For all technical information, please consult the 2006 Industrial Controls Catalog or contact your local sales support center.

① (A) For sizes 73YT & 73ZT, mods IC & A12 are available and can have both either individually or both at the same time; (B) For sizes 74YT & 74ZT (combination w/ICB), mods IC & A12 are only available individually (NOT both at the same time); (C) For sizes 74YT & 74ZT (combination w/ fusible disc), mods IC & A12 are NOT available individually or both.  
 ② An isolation contactor is included for 3RW40 version with bypass.

③ An isolation contactor is standard on all 3RW40 new styles  
 ④ Includes mod box price, change 8th character to G.  
 ⑤ Pilot lights are transformer type as standard. For LED type bulbs, order suffix FE in addition to the standard device suffix(es). For example, to order red "ON" and green "OFF" pilot lights with LED bulbs, order FA, FK and FE.

# 3RW Soft Starters

## 3RW30 for standard applications

### Overview

The SIRIUS 3RW30 soft starters reduce the motor voltage through variable phase control and increase it in ramp-like mode from a selectable starting voltage up to mains voltage. During starting, these devices limit the torque as well as the current and prevent the shocks which arise during direct starts or wye-delta starts. In this way, mechanical loads and mains voltage dips can be reliably reduced.

Soft starting reduces the stress on the connected equipment and results in lower wear and therefore longer periods of trouble-free production. The selectable start value means that the soft starters can be adjusted individually to the requirements of the application in question and unlike wye-delta starters are not restricted to two-stage starting with fixed voltage ratios.

The SIRIUS 3RW30 soft starters are characterized above all by their small space requirements. Integrated bypass contacts mean that no power loss has to be taken into the bargain at the power semiconductors (thyristors) after the motor has started up. This cuts down on heat losses, enabling a more compact design and making external bypass circuits superfluous.

Various versions of the SIRIUS 3RW30 soft starters are available:

- Standard version for fixed-speed three-phase motors, sizes S00, S0, S2 and S3, with integrated bypass contact system
- Version for fixed-speed three-phase motors in a 22.5 mm enclosure without bypass

Soft starters rated up to 75Hp (at 460 V) for standard applications in three-phase networks are available. Extremely small sizes, low power losses and simple commissioning are just three of the many advantages of this soft starter.

### Function

The space required by the compact SIRIUS 3RW30 soft starter is often only about one third of that required by a contactor assembly for wye-delta starting of comparable rating. This not only saves space in the control cabinet and on the standard mounting rail but also does away completely with the wiring work needed for wye-delta starters. This is notable in particular for higher motor ratings which are only rarely available as fully wired solutions.

At the same time the number of cables from the starter to the motor is reduced from six to three. Compact dimensions, short start-up times, easy wiring and fast commissioning make themselves felt as clear-cut cost advantages.

The bypass contacts of these soft starters are protected during operation by an integrated solid-state arc quenching system. This prevents damage to the bypass contacts in the event of a fault, e. g. brief disconnection of the control voltage, mechanical shocks or life-related component defects on the coil operating mechanism or main contact spring.

The new series of devices comes with the "polarity balancing" control method, which is designed to prevent direct current components in two-phase controlled soft starters. On two-phase controlled soft starters the current resulting from superimposition of the two controlled phases flows in the uncontrolled phase. This results for physical reasons in an asymmetric distribution of the three phase currents during the motor ramp-up. This phenomenon cannot be influenced, but in most applications it is non-critical.

Controlling the power semiconductors results not only in this unbalance, however, but also in the previously mentioned direct current components which can cause severe noise generation on the motor at starting voltages of less than 50 %. The control method used for these soft starters eliminates these direct current components during the ramp-up phase and prevents the braking torque which they can cause.

It creates a motor ramp-up that is uniform in speed, torque and current rise, thus permitting a particularly gentle, two-phase starting of the motors. At the same time the acoustic quality of the starting operation comes close to the quality of a three-phase controlled soft starter. This is made possible by the on-going dynamic harmonizing and balancing of current half-waves of different polarity during the motor ramp-up. Hence the name "polarity balancing".

- Soft starting with voltage ramp; the starting voltage setting range  $U_s$  is 40 % to 100 % and the ramp time  $t_R$  can be set from 0 s to 20 s
- Integrated bypass contact system to minimize power loss
- Setting with two potentiometers
- Simple mounting and commissioning
- Mains voltages at 50/60 Hz, 200 to 480 V
- Two control voltage versions 24 V AC/DC and 110 to 230 V AC/DC
- Wide temperature range from -25 °C to +60 °C
- The built-in auxiliary contact ensures user-friendly control and possible further processing within the system ([for status graphs see page 7/54](#))

For solid-state motor controller, Type 3RW301: Applicable in an enclosure with minimum overall dimensions of 200 by 120 by 200 mm.

For solid-state motor controller, Type 3RW302: Applicable in an enclosure with minimum overall dimensions of 370 by 175 by 195 mm.

For solid-state motor controller, Type 3RW303: Applicable in an enclosure with minimum overall dimensions of 450 by 220 by 235 mm.

For solid-state motor controller, Type 3RW304: Applicable in an enclosure with minimum overall dimensions of 450 by 220 by 235 mm.

# 3RW Soft Starters

## 3RW30 for standard applications

### Fuse assignment

The type of coordination to which the motor feeder with soft starter is mounted depends on the application-specific requirements. Normally, fuseless mounting (combination of motor starter protector/circuit breaker and soft starter) is sufficient.

If type of coordination "2" is to be fulfilled, semiconductor fuses must be fitted in the motor feeder.

### Fused version (line protection only)

Soft starters TOC 1 Q11 Type	Rated current A	Line protection, maximum		Size	Line contactors (optional) Q21
		F1 Type	Rated current A		
<b>Type of coordination "1"<sup>1)</sup>: <math>I_q = 65 \text{ kA at } 480 \text{ V } 10 \%</math></b>

## 3RW30 for standard applications

### Characteristic curves

#### Permissible installation height

At an installation height above 2000 m, the max. permissible operational voltage is reduced to 460 V.

### More information

#### Application examples for normal starting (Class 10)

**Normal starting Class 10** (up to 20 s with 300 %  $I_{n \text{ motor}}$ ).  
 The soft starter rating can be selected to be as high as the rating of the motor used

Application	Conveyor belt	Roller conveyor	Compressor	Small fan	Pump	Hydraulic pump
<b>Starting parameters</b>						
• Voltage ramp and current limiting						
- Starting voltage	% 70	60	50	40	40	40
- Starting time	s 10	10	20	20	10	10

*Note:*  
 These tables present sample set values and device sizes. They are intended only for the purposes of information and are not binding. The set values depend on the application in question and must be optimized during commissioning.  
 The soft starter dimensions should be checked where necessary with the Win-Soft Starter software or with the help of Technical Assistance.

# 3RW Soft Starters

## 3RW30 for standard applications

### Configuration

The 3RW solid-state motor controllers are designed for easy starting conditions. In the event of deviating conditions or increased switching frequency, it may be necessary to choose a larger device. For accurate dimensioning, use the Win-Soft Starter selection and simulation program.

If necessary, an overload relay for heavy starting must be selected where long starting times are involved. PTC sensors are recommended.

In the motor feeder between the SIRIUS 3RW soft starter and the motor, no capacitive elements are permitted (e. g. no reactive-power compensation equipment). In addition, neither static systems for reactive-power compensation nor dynamic PFC (Power Factor Correction) must be operated in parallel during starting and ramp-down of the soft starter. This is important to prevent faults arising on the compensation equipment and/or the soft starter.

All elements of the main circuit (such as fuses, controls and overload relays) should be dimensioned for direct starting, following the local short-circuit conditions. Fuses, controls and overload relays must be ordered separately. Please observe the maximum switching frequencies specified in the technical specifications.

**Note:**

*When induction motors are switched on, voltage drops occur as a rule on starters of all types (direct starters, wye-delta starters, soft starters). The infeed transformer must always be dimensioned such that the voltage dip when starting the motor remains within the permissible tolerance. If the infeed transformer is dimensioned with only a small margin, it is best for the control voltage to be supplied from a separate circuit (independently of the main voltage) in order to avoid the potential switching off of the soft starter.*

### Schematic circuit diagram

A bypass contact system is already integrated in the 3RW30 soft starter and therefore does not have to be ordered separately.

### Status graphs

### Win-Soft Starter selection and simulation program

With this software, you can simulate and select all Siemens soft starters, taking into account various parameters such as mains properties, motor and load data, and special application requirements.

The software is a valuable tool, which makes complicated, lengthy manual calculations for determining the required soft starters superfluous.

The Win-Soft Starter selection and simulation program can be downloaded from:

[www.usa.siemens.com/softstarters](http://www.usa.siemens.com/softstarters) > Software

More information can be found on the Internet at:

[www.usa.siemens.com/softstarters](http://www.usa.siemens.com/softstarters)

# 3RW Soft Starters

## 3RW40 for standard applications

### Overview

SIRIUS 3RW40 soft starters have all the same advantages as the 3RW30 soft starters.

The SIRIUS 3RW40 soft starters are characterized above all by their small space requirements. Integrated bypass contacts mean that no power loss has to be taken into the bargain at the power semiconductors (thyristors) after the motor has started up. This cuts down on heat losses, enabling a more compact design and making external bypass circuits superfluous.

At the same time this soft starter comes with additional integrated functions such as adjustable current limiting, motor overload and intrinsic device protection, and optional thermistor motor protection. The higher the motor rating, the more important these functions because they make it unnecessary to purchase and install protection equipment such as overload relays.

Internal intrinsic device protection prevents the thermal overloading of the thyristors and the power section defects this can cause. As an option the thyristors can also be protected by semiconductor fuses from short-circuiting.

Thanks to integrated status monitoring and fault monitoring, this compact soft starter offers many different diagnostics options. Up to four LEDs and relay outputs permit differentiated monitoring and diagnostics of the operating mechanism by indicating the operating state as well as for example mains or phase failure, missing load, non-permissible tripping time/class setting, thermal overloading or device faults.

Soft starters rated up to 300 Hp (at 460 V) for standard applications in three-phase networks are available. Extremely small sizes, low power losses and simple start-up are just three of the many advantages of the SIRIUS 3RW40 soft starters.

#### **"Increased safety" type of protection EEx e according to ATEX directive 94/9/EC**

The 3RW40 soft starter sizes S0 to S12 are suitable for the starting of explosion-proof motors with "increased safety" type of protection EEx e.

See "Appendix" -> "Standards and approvals" -> "Type overview of approved devices for potentially explosive areas (ATEX explosion protection)".

### Function

The space required by the compact SIRIUS 3RW40 soft starter is often only about one third of that required by a contactor assembly for wye-delta starting of comparable rating. This not only saves space in the control cabinet and on the standard mounting rail but also does away completely with the wiring work needed for wye-delta starters. This is notable in particular for higher motor ratings which are only rarely available as fully wired solutions.

At the same time the number of cables from the starter to the motor is reduced from six to three. Compact dimensions, short start-up times, easy wiring and fast commissioning make themselves felt as clear-cut cost advantages.

The bypass contacts of these soft starters are protected during operation by an integrated solid-state arc quenching system. This prevents damage to the bypass contacts in the event of a fault, e. g. brief disconnection of the control voltage, mechanical shocks or life-related component defects on the coil operating mechanism or main contact spring.

The starting current of particularly powerful operating mechanisms can place an unjustifiable load on the local supply system. Soft starters reduce this starting current by means of their voltage ramp. Thanks to the adjustable current limiting, the SIRIUS 3RW40 soft starter takes even more pressure off the supply system. It leaves the set start ramp during the ramp-up – the ramp gradient is fixed by the starting voltage and the ramp time – as soon as the selected current limit is reached. From this moment the voltage of the soft starter is controlled so that the current supplied to the motor remains constant. This process is ended either by completion of the motor ramp-up or by tripping by the intrinsic device protection or the motor overload protection. As the result of this function the actual motor ramp-up can well take longer than the ramp time selected on the soft starter.

Thanks to the integrated motor overload protection according to IEC 60947-4-2 there is no need of an additional overload relay on the new soft starters. The rated motor current, the setting of the overload tripping time (Class times) and the reset of the motor overload protection function can be adjusted easily and quickly. Using a 4-step rotary potentiometer it is possible to set different overload tripping times on the soft starter. In addition to Class 10, 15 and 20 it is also possible to switch off the motor overload protection if a different motor management control device is to be used for this function, e. g. with connection to PROFIBUS.

Device versions with thermistor motor protection evaluation are available up to a rating of 55 kW (at 400 V). A "Thermoclick" measuring probe can be connected directly, as can a PTC of type A. Thermal overloading of the motor, open circuits and short-circuits in the sensor circuit all result in the direct disconnection of the soft starter. And if ever the soft starter trips, various reset options are available the same as with intrinsic device protection and motor load protection: manually with the reset button, automatically or remotely through brief disconnection of the control voltage.

The new series of devices comes with the "polarity balancing" control method, which is designed to prevent direct current components in two-phase controlled soft starters. On two-phase controlled soft starters the current resulting from superimposition of the two controlled phases flows in the uncontrolled phase. This results for physical reasons in an asymmetric distribution of the three phase currents during the motor ramp-up. This phenomenon cannot be influenced, but in most applications it is non-critical.

Controlling the power semiconductors results not only in this unbalance, however, but also in the previously mentioned direct current components which can cause severe noise generation on the motor at starting voltages of less than 50 %.

The control method used for these soft starters eliminates these direct current components during the ramp-up phase and prevents the braking torque which they can cause. It creates a motor ramp-up that is uniform in speed, torque and current rise, thus permitting a particularly gentle, two-phase starting of the motors. At the same time the acoustic quality of the starting operation comes close to the quality of a three-phase controlled soft starter. This is made possible by the on-going dynamic harmonizing and balancing of current half-waves of different polarity during the motor ramp-up. Hence the name "polarity balancing".

# 3RW Soft Starters

## 3RW40 for standard applications

As an option the thyristors can also be protected by SITOR semiconductor fuses from short-circuiting so that the soft starter is still functional after a short-circuit (type of coordination 2). Three LEDs are used to indicate the operating state as well as possible errors, e. g. non-permissible tripping time (CLASS setting), mains or phase failure, missing load, thermal overloading or device faults.

- Soft starting with voltage ramp; the starting voltage setting range  $U_s$  is 40 to 100 % and the ramp time  $t_R$  can be set from 0 to 20 s.<sup>3)</sup>
- Smooth ramp-down with voltage ramp; the running down time  $t_{off}$  can be set between 0 s to 20 s.<sup>3)</sup>
- Solid-state motor overload and intrinsic device protection
- Optional thermistor motor protection (up to size S3)
- Remote reset (integrated up to size S3, optional for size S6 and larger)
- Adjustable current limiting

- Integrated bypass contact system to minimize power loss
- Setting with potentiometers
- Simple mounting and commissioning
- Integrated status monitoring and fault monitoring
- Mains voltages 50/60 Hz, 200 to 600 V
- Various control voltage versions
  - Sizes S0 to S3: 24 V AC/DC and 110 to 230 V AC/DC
  - Sizes S6 to S12: 115 V AC and 230 V AC.
 Control by way of the internal 24 V DC supply and direct control by means of PLC are possible.
- Wide temperature range from -25 to +60 °C
- Built-in auxiliary contacts ensure user-friendly control and possible further processing within the system (for status graphs see page 7/69)

### More information

#### Application examples for normal starting (Class 10)

**Normal starting Class 10** (up to 20 s with 350 %  $I_{n, motor}$ ).

The soft starter rating can be selected to be as high as the rating of the motor used.

Application	Conveyor belt	Roller conveyor	Small fan	Pump	Hydraulic pump
<b>Starting parameters</b>					
• Voltage ramp and current limiting					
- Starting voltage	%	70	60	40	40
- Starting time	s	10	10	10	10
- Current limit value		$5 \times I_M$	$5 \times I_M$	$4 \times I_M$	$4 \times I_M$
<b>Ramp-down time</b>	s	5	5	0	10

#### Application examples for heavy starting (Class 20)

**Heavy starting Class 20** (up to 40 s with 350 %  $I_{n, motor}$ ).

The soft starter has to be selected at least one performance class higher than the motor used.

Application	Stirrer	Compressor	Centrifuge
<b>Starting parameters</b>			
• Voltage ramp and current limiting			
- Starting voltage	%	40	50
- Starting time	s	20	10
- Current limit value		$4 \times I_M$	$4 \times I_M$
<b>Ramp-down time</b>		0	0

Note:

These tables present sample set values and device sizes. They are intended only for the purposes of information and are not binding. The set values depend on the application in question and must be optimized during commissioning.

The soft starter dimensions should be checked where necessary with the Win-Soft Starter software or with the help of Technical Assistance.

# 3RW Soft Starters

## 3RW40 for standard applications

### Configuration

The 3RW solid-state soft starters are designed for easy starting conditions. In the event of deviating conditions or increased switching frequency, it may be necessary to choose a larger device. For accurate dimensioning, use the Win-Soft Starter selection and simulation program.

Where long starting times are involved, the integrated solid-state overload relay for heavy starting should not be disconnected. PTC sensors are recommended. This also applies for the smooth ramp-down because during the ramp-down time an additional current loading applies in contrast to free ramp-down.

In the case of high switching frequencies in S4 mode, Siemens recommends the use of PTC sensors. For corresponding device versions with integrated thermistor motor protection or separate thermistor evaluation devices see Catalog LV 1.

In the motor feeder between the SIRIUS 3RW soft starter and the motor, no capacitive elements are permitted (e. g. no reactive-power compensation equipment). In addition, neither static systems for reactive-power compensation nor dynamic PFC (Power Factor Correction) must be operated in parallel during starting and ramp-down of the soft starter. This is important to prevent faults arising on the compensation equipment and/or the soft starter.

All elements of the main circuit (such as fuses and controls) should be dimensioned for direct starting, following the local short-circuit conditions. Fuses, controls and overload relays must be ordered separately. Please observe the maximum switching frequencies specified in the technical specifications.

**Note:**

*When induction motors are switched on, voltage drops occur as a rule on starters of all types (direct starters, wye-delta starters, soft starters). The infeed transformer must always be dimensioned such that the voltage dip when starting the motor remains within the permissible tolerance. If the infeed transformer is dimensioned with only a small margin, it is best for the control voltage to be supplied from a separate circuit (independently of the main voltage) in order to avoid the potential switching off of the soft starter.*

### Schematic circuit diagram

A bypass contact system and solid-state overload relay are already integrated in the 3RW40 soft starter and therefore do not have to be ordered separately.

### Status graphs

### Win-Soft Starter selection and simulation program

With this software, you can simulate and select all Siemens soft starters, taking into account various parameters such as mains properties, motor and load data, and special application requirements.

The software is a valuable tool, which makes complicated, lengthy manual calculations for determining the required soft starters superfluous.

The Win-Soft Starter selection and simulation program can be downloaded from:

[www.usa.siemens.com](http://www.usa.siemens.com) > Software

More information can be found on the Internet at:

[www.usa.siemens.com](http://www.usa.siemens.com).

# 3RW Soft Starters

## 3RW44 for high-feature applications

### Overview

In addition to soft starting and soft ramp-down, the solid-state SIRIUS 3RW44 soft starters provide numerous functions for higher-level requirements. They cover a performance range up to 900 Hp (at 460 V) in the inline circuit and up to 1600 Hp (at 460 V) in the inside-delta circuit.

The SIRIUS 3RW44 soft starters are characterized by a compact design for space-saving and clearly arranged control cabinet layouts. For optimized motor starting and stopping the innovative SIRIUS 3RW44 soft starters are an attractive alternative with considerable savings potential compared to applications with a frequency converter. The new torque control and adjustable current limiting enable the High-Feature soft starters to be used in nearly every conceivable task. They reliably mitigate the sudden torque applications and current peaks during motor starting and stopping. This creates savings potential when calculating the size of the controlgear and when servicing the machinery installed. Be it for inline circuits or inside-delta circuits – the SIRIUS 3RW44 soft starter offers savings especially in terms of size and equipment costs.

The bypass contacts already integrated in the soft starter bypass the thyristors after a motor ramp-up is detected. This results in a further great reduction in the heat loss occurring during operation of the soft starter at rated value.

Combinations of various starting, operating and ramp-down possibilities ensure an optimum adaptation to the application-specific requirements. Operation and commissioning can be performed with the menu-controlled keypad and a menu-prompted, multi-line graphic display with background lighting. The optimized motor ramp-up and ramp-down can be effected quickly, easily and reliably by means of just a few settings with a previously selected language. Four-key operation and plain-text displays for each menu point guarantee full clarity at every moment of the parameterization and operation.

#### Applicable standards

- IEC 60947-4-2
- UL/CSA

#### Soft Starter ES parameterization software

Soft Starter ES software is used for the parameterization, monitoring and service diagnostics of SIRIUS 3RW44 High Feature soft starters.

See Catalog LV 1, Chapter 12 "Planning and Configuration with SIRIUS".

### Function

Equipped with modern, ergonomic user prompting the SIRIUS 3RW44 soft starters can be commissioned quickly and easily using a keypad and a menu-prompted, multi-line graphic display with background lighting. The optimized motor ramp-up and ramp-down can be effected quickly, easily and reliably by means of just a few settings with a selectable language. Four-key operation and plain-text displays for each menu point guarantee full clarity at every moment of the parameterization and operation. During operation and when control voltage is applied, the display field continuously presents measured values and operating values as well as warnings and fault messages. An external display and operator module can be connected by means of a connection cable to the soft starter, thus enabling active indications and the like to be read directly from the control cabinet door.

The SIRIUS 3RW44 soft starters are equipped with optimum functionality. An integral bypass contact system reduces the power loss of the soft starter during operation.

This reliably prevents heating of the switchgear environment. The SIRIUS 3RW44 soft starters have internal intrinsic device protection. This prevents thermal overloading of the power section's thyristors, e. g. due to unacceptably high closing operations.

Wiring outlay for installing an additional motor overload relay is no longer needed as the SIRIUS 3RW44 soft starters perform this function too. In addition they offer adjustable trip classes and a thermistor motor protection function. As an option the thyristors can also be protected by SITOR semiconductor fuses from short-circuiting so that the soft starter is still functional after a short-circuit (type of coordination 2). And even inrush current peaks are reliably avoided thanks to adjustable current limiting.

As a further option the SIRIUS 3RW44 soft starters can be upgraded with a PROFIBUS DP module. Thanks to their communication capability and their programmable control inputs and relay outputs the SIRIUS 3RW44 soft starters can be very easily and quickly integrated in higher-level controllers.

In addition a creep speed function is available for positioning and setting jobs. With this function the motor can be controlled in both directions of rotation with reduced torque and an adjustable, low speed.

On the other hand the SIRIUS 3RW44 soft starters offer a new, combined DC braking function for the fast stopping of driving loads.

#### Highlights

- Soft starting with breakaway pulse, torque control or voltage ramp, adjustable torque or current limiting as well as any combination of these, depending on load type
- Integrated bypass contact system to minimize power loss
- Various setting options for the starting parameters such as starting torque, starting voltage, ramp-up and ramp-down time, and much more in three separate parameter sets
- Start-up detection
- Inside-delta circuit for savings in terms of size and equipment costs
- Various ramp-down modes selectable: free ramp-down, torque-controlled pump ramp-down, combined DC braking
- Solid-state motor overload and intrinsic device protection
- Thermistor motor protection
- Keypad with a menu-prompted, multi-line graphic display with background lighting
- Interface for communication with the PC for more accurate setting of the parameters as well as for control and monitoring
- Simple adaptation to the motor feeder
- Simple mounting and commissioning
- Display of operating states and fault messages
- Connection to PROFIBUS with optional PROFIBUS DP module
- External display and operator module
- Mains voltages from 200 to 690 V, 50 to 60 Hz
- Applicable up to 60 °C (derating from 40 °C)

# 3RW Soft Starters

## 3RW44 for high-feature applications

Type		3RW44 ...BC.4	3RW44 ...BC.5	3RW44 ...BC.6
<b>Power electronics</b>				
<b>Rated operational voltage for inline circuit</b>	V AC	200 ... 460	400 ... 600	400 ... 690
Tolerance	%	-15/+10	-15/+10	-15/+10
<b>Maximum blocking voltage (thyristor)</b>	V AC	1400	1800	1800
<b>Rated operational voltage for inside-delta circuit</b>	V AC	200 ... 460	400 ... 600	400 ... 600
Tolerance	%	-15/+10	-15/+10	-15/+10
<b>Rated frequency</b>	Hz	50 ... 60		
Tolerance	%	±10		
<b>Uninterrupted duty at 40 °C (% of I<sub>e</sub>)</b>	%	115		
<b>Minimum load (% of set motor current I<sub>M</sub>)</b>	%	8		
<b>Maximum cable length</b> between soft starter and motor	m	500 <sup>1)</sup>		
<b>Permissible installation height</b>	m	5000 (derating from 1000, see characteristic curves); higher on request		
<b>Permissible mounting position</b>				
<b>Installation type</b>		Stand-alone installation		
<b>Permissible ambient temperature</b>		Operation °C: 0 ... +60; (derating from +40) Storage °C: -25 ... +80		
<b>Degree of protection</b>		IP00		

1) At the project configuration stage, it is important to make allowance for the voltage drop on the motor cable up to the motor connection. If necessary,

higher values for the rated operational voltage or current must be calculated accordingly for the soft starter.

- 115 V AC
- 230 V AC

<sup>1)</sup> In the selection table, the unit rated current  $I_e$  refers to the induction motor's rated operational current in the inside-delta circuit. The actual current of the device is approx. 58 % of this value.

<sup>2)</sup> 3RW44 2 ... 3RW44 4. soft starters with screw terminals: delivery times ▶ (preferred type),

<sup>3)</sup> Control by way of the internal 24 V DC supply and direct control by means of PLC possible.

**Note:**

Soft starter selection depends on the rated motor current.

The 3RW44 solid-state soft starters are designed for normal starting (Class 10). (Inertia load of the overall operating mechanism  $J_{Load} < 10 \times J_{Motor}$ ; starting current 350 %  $\times I_e$  for 20 s similar load). For any other conditions of use, the devices should be selected using the Win-Soft Starter selection and simulation program. See Technical specifications for information about rated currents for ambient temperatures > 40 °C and switching frequency.

1) If the ramp-down function "Combined braking" is selected, no braking contactor is required.  
If the ramp-down function "DC braking" is selected, a braking contactor must be used in addition (see table for type).  
For applications with large centrifugal masses ( $J_{Load} > J_{Motor}$ ) we recommend the function "DC braking".

2) Additional auxiliary relay K4:  
LZX:RT4A4T30  
(3RW44 soft starter with rated control supply voltage 230 V AC),  
LZX:RT4A4S15  
(3RW44 soft starter with rated control supply voltage 115 V AC).

3) The type of coordination "2" refers only to soft starters in combination with the stipulated protective device (motor starter protector/circuit breaker/fuse), not to any additional components in the feeder.  
[The types of coordination are explained under "3RA1 Fuseless Load Feeders".](#)

# 3RW Soft Starters

## 3RW44 for high-feature applications

### Inline circuit fused version with 3NE or 3NC SITOR semiconductor fuse

(semiconductor protection by fuse, line and overload protection by motor starter protector/circuit breaker)

For matching fuse bases see Catalog LV 1 under "SENTRON Switching and Protection Devices for Power Distribution" → "Switch Disconnectors", and Catalog ET B1 under "BETA Protecting" → "SITOR Semiconductor Fuses" or go to [www.siemens.com/sitor](http://www.siemens.com/sitor) → "Products" → "BETA Protecting" → "SITOR"

1) If the ramp-down function "Combined braking" is selected, no braking contactor is required. If the ramp-down function "DC braking" is selected, a braking contactor must be used in addition (see table for type). For applications with large centrifugal masses ( $J_{Load} > J_{Motor}$ ) we recommend the function "DC braking".

2) Additional auxiliary relay K4:  
LZX:RT4A4T30  
(3RW44 soft starter with rated control supply voltage 230 V AC),  
LZX:RT4A4S15  
(3RW44 soft starter with rated control supply voltage 115 V AC).

3) The type of coordination "2" refers only to soft starters in combination with the stipulated protective device (motor starter protector/circuit breaker/fuse), not to any additional components in the feeder. The types of coordination are explained under "3RA1 Fuseless Load Feeders".

### More information

#### Application examples for normal starting (Class 10)

**Normal starting Class 10** (up to 20 s with 350 %  $I_{n \text{ motor}}$ ).

The soft starter rating can be selected to be as high as the rating of the motor used

Application	Conveyor belt	Roller conveyor	Compressor	Small fan	Pump	Hydraulic pump
<b>Starting parameters</b>						
• Voltage ramp and current limiting						
- Starting voltage	%	70	60	50	30	30
- Starting time	s	10	10	10	10	10
- Current limit value		Deactivated	Deactivated	$4 \times I_M$	$4 \times I_M$	Deactivated
• Torque ramp						
- Starting torque		60	50	40	20	10
- End torque		150	150	150	150	150
- Starting time		10	10	10	10	10
• Breakaway pulse						
		Deactivated (0 ms)	Deactivated (0 ms)	Deactivated (0 ms)	Deactivated (0 ms)	Deactivated (0 ms)
<b>Ramp-down mode</b>						
		Smooth ramp-down	Smooth ramp-down	Free ramp-down	Free ramp-down	Pump ramp-down
						Free ramp-down

#### Application examples for heavy starting (Class 20)

**Heavy starting Class 20** (up to 40 s with 350 %  $I_{n \text{ motor}}$ ).

The soft starter has to be selected one performance class higher than the motor used

Application	Stirrer	Centrifuge	Milling machine
<b>Starting parameters</b>			
• Voltage ramp and current limiting			
- Starting voltage	%	30	30
- Starting time	s	30	30
- Current limit value		$4 \times I_M$	$4 \times I_M$
• Torque ramp			
- Starting torque		30	30
- End torque		150	150
- Starting time		30	30
• Breakaway pulse			
		Deactivated (0 ms)	Deactivated (0 ms)
<b>Ramp-down mode</b>			
		Free ramp-down	Free ramp-down or DC braking

#### Application examples for very heavy starting (Class 30)

**Very heavy starting Class 30** (up to 60 s with 350 %  $I_{n \text{ motor}}$ ).

The soft starter has to be selected two performance classes higher than the motor used

Application	Large fan	Mill	Crusher	Circular saw/bandsaw
<b>Starting parameters</b>				
• Voltage ramp and current limiting				
- Starting voltage	%	30	50	30
- Starting time	s	60	60	60
- Current limit value		$4 \times I_M$	$4 \times I_M$	$4 \times I_M$
• Torque ramp				
- Starting torque		20	50	20
- End torque		150	150	150
- Starting time		60	60	60
• Breakaway pulse				
		Deactivated (0 ms)	80 %, 300 ms	Deactivated (0 ms)
<b>Ramp-down mode</b>				
		Free ramp-down	Free ramp-down	Free ramp-down

**Note:**

These tables present sample set values and device sizes. They are intended only for the purposes of information and are not binding. The set values depend on the application in question and must be optimized during commissioning. The soft starter dimensions should be checked where necessary with the Win-Soft Starter software or with the help of Technical Assistance.

# 3RW Soft Starters

## Circuit concept

The SIRIUS 3RW44 soft starters can be operated in two different types of circuit.

- **Inline circuit**  
The controls for isolating and protecting the motor are simply connected in series with the soft starter. The motor is connected to the soft starter with three cables.
- **Inside-delta circuit**  
The wiring is similar to that of wye-delta starters. The phases of the soft starter are connected in series with the individual motor windings. The soft starter then only has to carry the phase current, amounting to about 58 % of the rated motor current (conductor current).

## Comparison of the types of circuit

Inline circuit:  
Rated current  $I_g$  corresponds to the rated motor current  $I_n$ , 3 cables to the motor

Inside-delta circuit:  
Rated current  $I_g$  corresponds to approx. 58 % of the rated motor current  $I_n$ , 6 cables to the motor (as with wye-delta starters)

## Which circuit?

Using the inline circuit involves the lowest wiring outlay. If the soft starter to motor connections are long, this circuit is preferable.

With the inside-delta circuit there is double the wiring complexity but a smaller size of device can be used at the same rating.

Thanks to the choice of operating mode between the inline circuit and inside-delta circuit, it is always possible to select the most favorable solution.

The braking function is possible only in the inline circuit.

## Configuration

The 3RW44 solid-state soft starters are designed for normal starting. In case of heavy starting or increased starting frequency, a larger device must be selected.

For long starting times it is recommended to have a PTC sensor in the motor. This also applies for the ramp-down modes smooth ramp-down, pump ramp-down and DC braking, because during the ramp-down time in these modes, an additional current load applies in contrast to free ramp-down.

In the motor feeder between the SIRIUS 3RW soft starter and the motor, no capacitive elements are permitted (e. g. no reactive-power compensation equipment). In addition, neither static systems for reactive-power compensation nor dynamic PFC (Power Factor Correction) must be operated in parallel during starting and ramp-down of the soft starter. This is important to prevent faults arising on the compensation equipment and/or the soft starter.

All elements of the main circuit (such as fuses and controls) should be dimensioned for direct starting, following the local short-circuit conditions. Fuses, controls and overload relays must be ordered separately.

A bypass contact system and solid-state overload relay are already integrated in the 3RW44 soft starter and therefore do not have to be ordered separately.

The harmonic component load for starting currents must be taken into consideration for the selection of motor starter protectors (selection of release).

### Note:

*When induction motors are switched on, voltage drops occur as a rule on starters of all types (direct starters, wye-delta starters, soft starters). The infeed transformer must always be dimensioned such that the voltage dip when starting the motor remains within the permissible tolerance. If the infeed transformer is dimensioned with only a small margin, it is best for the control voltage to be supplied from a separate circuit (independently of the main voltage) in order to avoid the potential switching off of the soft starter.*

## Device interface, PROFIBUS DP communication module, Soft Starter ES parameterizing and operating software

The 3RW44 electronic soft starters have a PC interface for communicating with the Soft Starter ES software or for connecting the external display and operator module. If the optional PROFIBUS communication module is used, the 3RW44 soft starter can be integrated in the PROFIBUS network and communicate using the GSD file or Soft Starter ES Premium software.

The Soft Starter ES parameterizing and operating software can be downloaded from [www.usa.siemens.com](http://www.usa.siemens.com) > Software with a 14-day trial license.

More information about Soft Starter ES can be found in Chapter 12 of Catalog LV 1.

# 3RW Soft Starters

## 3RW44 for high-feature applications

### *Manual for SIRIUS 3RW44*

Besides containing all important information on configuring, commissioning and servicing, the manual also contains example circuits and the technical specifications for all devices.

### *Win-Soft Starter selection and simulation program*

With this software, you can simulate and select all Siemens soft starters, taking into account various parameters such as mains properties, motor and load data, and special application requirements.

The software is a valuable tool, which makes complicated, lengthy manual calculations for determining the required soft starters superfluous.

The Win-Soft Starter selection and simulation program can be downloaded from: [www.usa.siemens.com](http://www.usa.siemens.com) > Software

More information can be found on the Internet at: [www.usa.siemens.com](http://www.usa.siemens.com)

# 3RW Soft Starters

## Project Planning aids

### 3RW44 connection examples for main and control circuits

#### Main circuit

Possibility 1a:  
Inline circuit with motor starter protector and SITOR fuse (semiconductor protection only)

#### Control circuit

Possibility 1:  
Control by pushbutton

#### Main circuit

Possibility 1b:  
Inline circuit with all-range protection (line and semiconductor protection)

Possibility 1c:  
Inline circuit with line and SITOR fuse (semiconductor protection only)

1) Permissible values for main and control voltage, see "Technical specifications".

2) **Caution: Risk of restarting!**  
Because the output is parameterized to "Motor ON", the start command is automatically active after the reset command and a new, automatic restart will take place. This applies especially in case of motor protection tripping. For safety reasons we recommend connecting the group error output (terminals 95/96) in series with the output parameterized to "Motor ON".

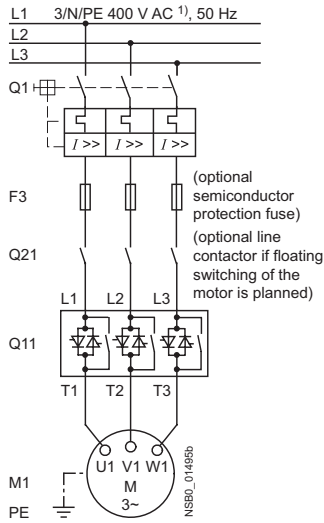

# 3RW Soft Starters

## Project Planning aids

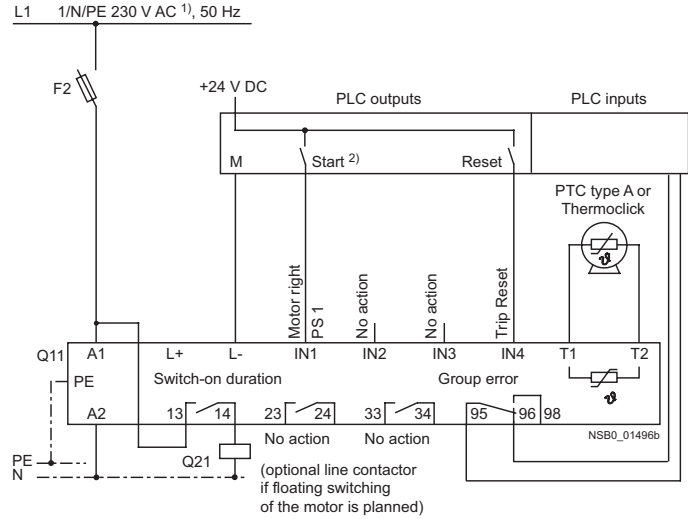

### Main circuit

Possibility 2:  
Inline circuit with main contactor

### Control circuit

Possibility 2:  
Control of a main contactor and control by means of PLC

1) Permissible values for main and control voltage, see "Technical specifications".

2) **Caution: Risk of restarting!**

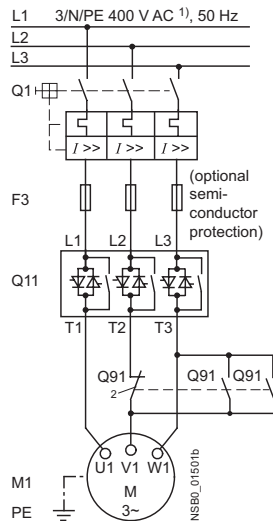

The start command (e. g. from the PLC) must be reset prior to a reset command because a new, automatic restart will take place automatically if a start command is active after the reset command. This applies especially in case of motor protection tripping. For safety reasons we recommend incorporating the group error output (terminals 95 and 96) in the controller.

# 3RW Soft Starters

## Project Planning aids

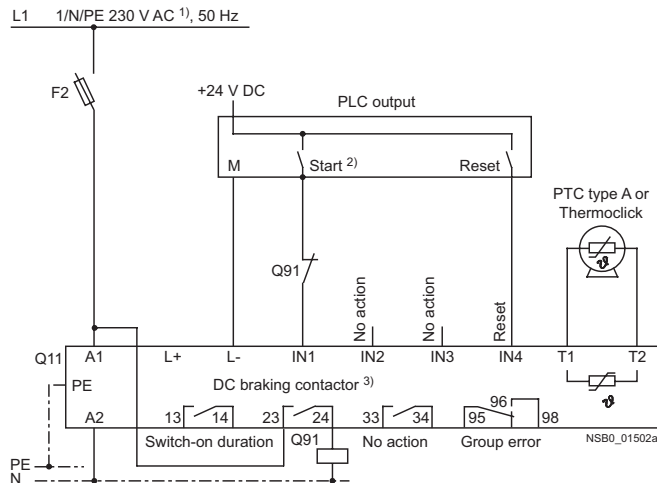

### Main circuit

Possibility 3a:  
 Inline circuit with ramp-down function DC braking<sup>3)</sup>  
 (for device types 3RW44 22 to 3RW44 25)

### Control circuit

Possibility 3a:  
 Control of the DC braking contactor<sup>3)</sup>

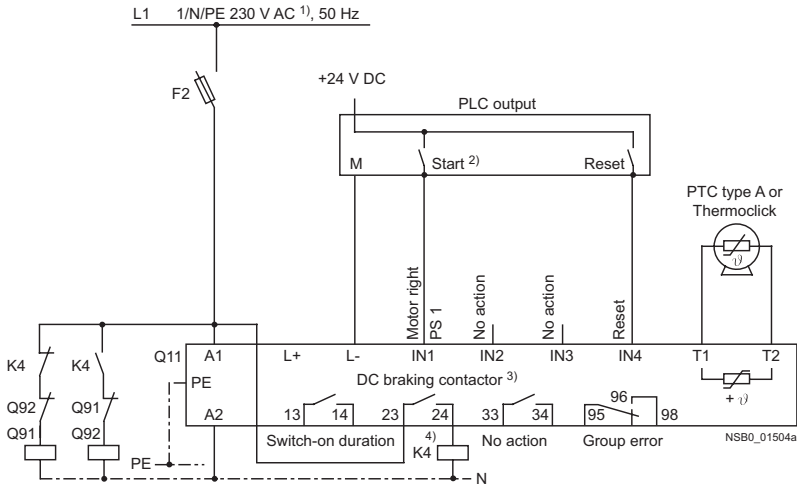

### Main circuit

Possibility 3b:  
 Inline circuit with ramp-down function DC braking<sup>3)</sup>  
 (for device types 3RW44 26 to 3RW44 47)

### Control circuit

Possibility 3b:  
 Control of the DC braking contactor<sup>3)</sup>

<sup>1)</sup> Permissible values for main and control voltage, see "Technical specifications".

<sup>2)</sup> **Caution: Risk of restarting!**

The start command (e. g. from the PLC) must be reset prior to a reset command because a new, automatic restart will take place automatically if a start command is active after the reset command. This applies especially in case of motor protection tripping. For safety reasons we recommend incorporating the group error output (terminals 95 and 96) in the controller.

<sup>3)</sup> If the ramp-down function "Combined braking" is selected, no braking contactor is required.

If the ramp-down function "DC braking" is selected, a braking contactor must be used in addition. For type see "Fuse Assignment (Inline Circuit)" on pages 7/47 to 7/49.

For applications with large centrifugal masses ( $J_{Load} > J_{Motor}$ ) we recommend the function "DC braking".

The output 2 must be switched over to "DC braking contactor".

<sup>4)</sup> Auxiliary relay K4, e. g.:

LZX:RT4A4T30 (230 V AC rated control supply voltage),  
 LZX:RT4A4S15 (115 V AC rated control supply voltage).

# 3RW Soft Starters

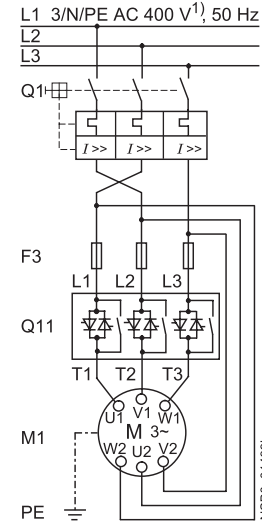

## Project Planning aids

### Main circuit

Possibility 4a:  
Inside-delta circuit

Possibility 4b:  
Change of direction of rotation for  
inside-delta circuit

### Control circuit

Possibility 4:  
Control by means of PLC

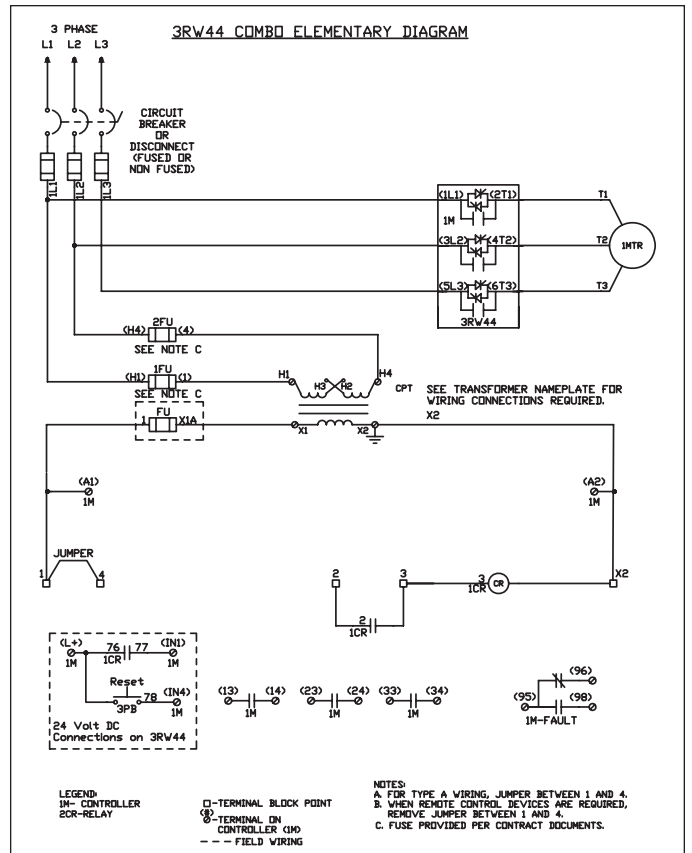

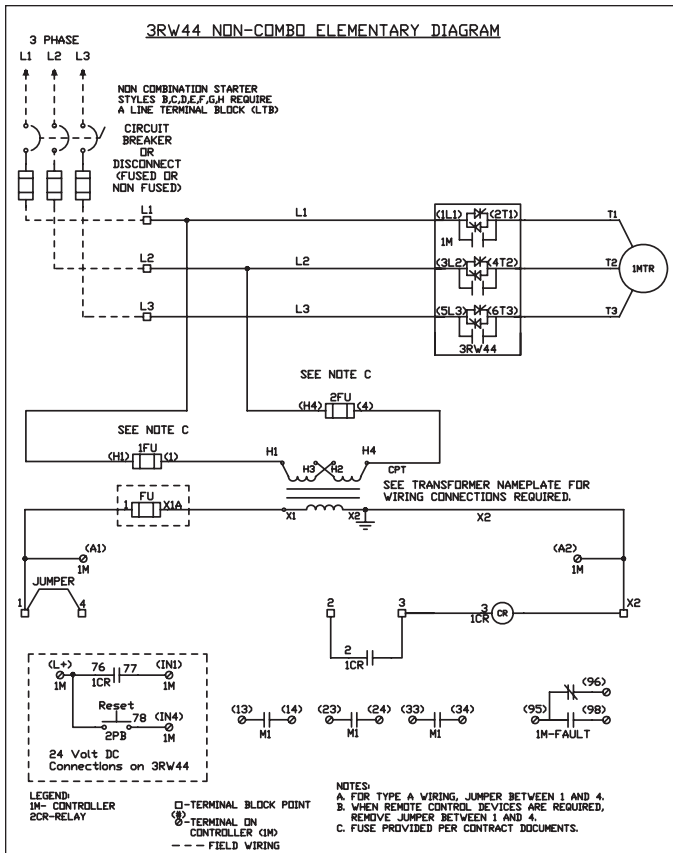

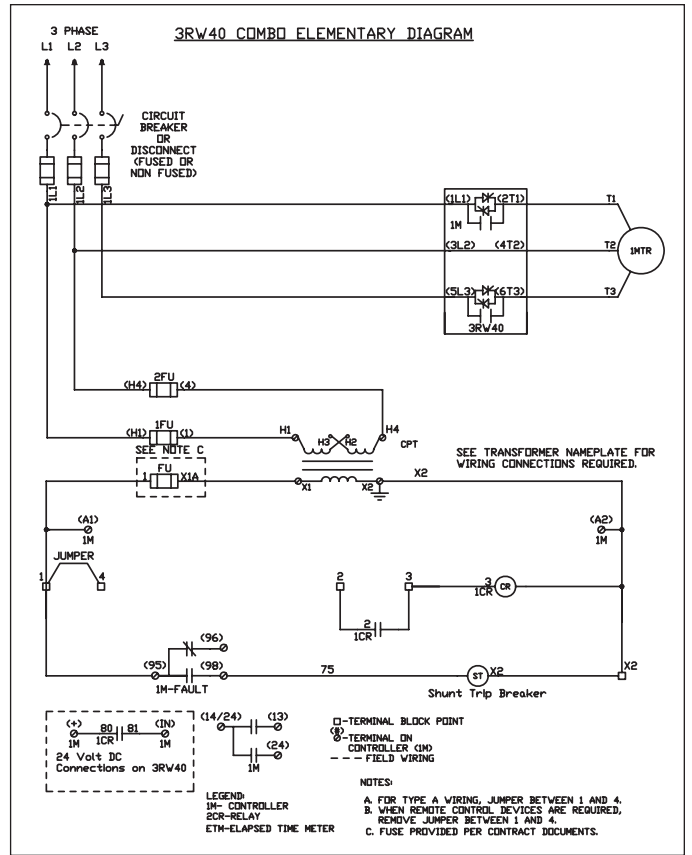

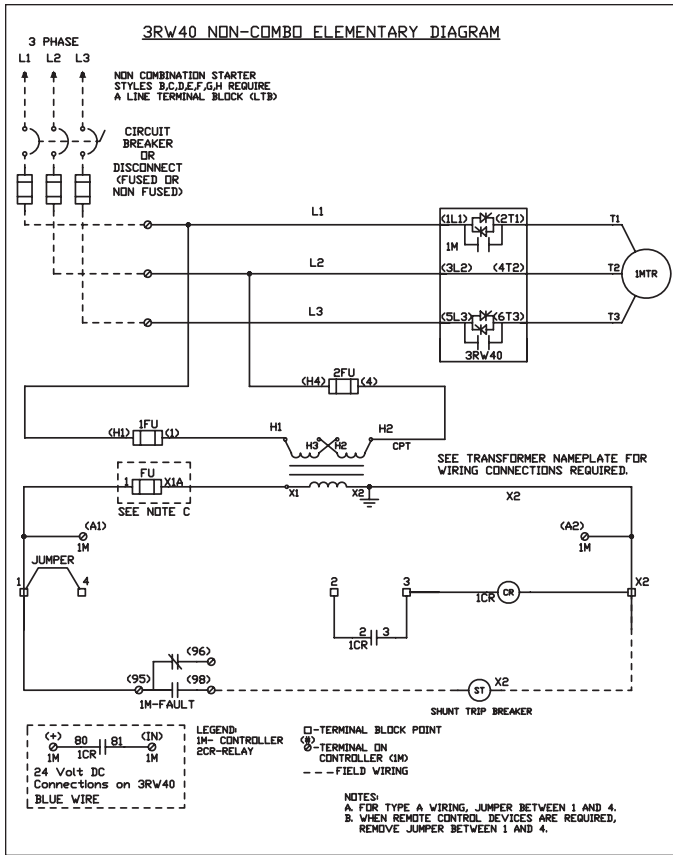

1) Permissible values for main and control voltage, see "Technical specifications".

2) **Caution: Risk of restarting!**

The start command (e. g. from the PLC) must be reset prior to a reset command because a new, automatic restart will take place automatically if a start command is active after the reset command. This applies especially in case of motor protection tripping. For safety reasons we recommend incorporating the group error output (terminals 95 and 96) in the controller.

## Overview

**SIRIUS 3RF2 solid-state switching devices**

Solid-state switching devices for resistive loads

- Solid-state relays
- Solid-state contactors
- Function modules

Solid-state switching devices for switching motors

- Solid-state contactors
- Solid state reversing contactors

**The most reliable solution for any application**

Compared to electro mechanical contactors, our SIRIUS 3RF2 solid-state switching devices stand out due to their considerably longer service life. Thanks to the high product quality, their switching is extremely precise, reliable and, above all, insusceptible to faults. With its variable connection methods and a wide spread of control voltages, the SIRIUS 3RF2 family is universally applicable. Depending on the individual requirements of the application, our modular switchgear can also be quite easily expanded by the addition of standardized function modules.

**Semiconductor relays**

SIRIUS SC semiconductor relays are suitable for surface mounting on existing cooling surfaces. Installation is quick and easy, involving just two screws. Depending on the nature of the heat sink, the capacity reaches up to 88 A on resistive loads. The 3RF21 semiconductor relays can be expanded with various function modules to adapt them to individual applications.

The semiconductor relays are available in 2 different widths:

- 3RF21 semiconductor relay with a width of 22.5 mm
- 3RF20 and 3RF22 semiconductor relay with a width of 45 mm

Both variants are only available in the "zero-point switching" version. This standard version is ideally suited for operation with resistive loads.

**Selecting semiconductor relays**

When selecting semiconductor relays, in addition to information about the power system, the load and the ambient conditions it is also necessary to know details of the planned design. The semiconductor relays can only conform to their specific technical specifications if they are mounted with appropriate care on an adequately dimensioned heat sink. The following procedure is recommended:

- Determine the rated current of the load and the mains voltage
- Select the relay design and choose a semiconductor relay with higher rated current than the load requires
- Determine the thermal resistance of the proposed heat sink
- Check the correct relay size with the aid of the diagram

**Solid-state contactors for switching motors**

The solid-state contactors for switching motors are intended for frequently switching on and off three-phase current operating mechanisms up to 5 HP and reversing up to 3 HP. The

devices are constructed with complete insulation and can be mounted directly to 3RV1 MSPs and SIRIUS overload relays, resulting in a very simple integration into motor feeders.

These three-phase solid-state contactors are equipped with a two-phase control which is particularly suitable for typical motor current circuits without connecting to the neutral conductor.

Important features:

- Insulated enclosure with integrated heat sink
- Degree of protection IP20
- Integrated mounting foot to snap on a standard mounting rail or for assembly onto a support plate
- Variety of connection methods
- Plug-in control connection
- Display via LEDs

**Selecting solid-state contactors**

The solid-state contactors are selected on the basis of details of the network, the load and the ambient conditions. As the solid-state contactors are already equipped with an optimally matched heat sink, the selection process is considerably simpler than that for solid-state relays.

The following procedure is recommended:

- Determine the rated current of the load and the mains voltage
- Select a solid-state contactor with the same or higher rated current than the load
- Testing the maximum permissible switching frequency based on the characteristic curves. To do this, the starting current, the starting time and the motor load in the operating phase must be known.
- If the permissible switching frequency is below the desired frequency, it is possible to achieve an increase by overdimensioning the motor.

**Benefits**

- Devices with integrated heat sink, "ready to use"
- Compact and space-saving design
- Reversing contactors with integrated interlocking

**Application****Standards and approvals**

- IEC 60947-4-3
- UL 508, CSA for North America<sup>1)</sup>
- CE marking for Europe
- C-Tick approval for Australia

<sup>1)</sup> Please note: For reversing motor applications use overvoltage protection device Type 3TX7462-3L; max. cut-off-voltage 6000 V; min. energy handling capability 100 J.

- Function is available
- Function is possible

**Note:** Permissible for use at altitudes of more than 2500 m above sea level with the following derating for 3RF2 Devices:

Site altitude 2500 m above sea level:

- Reduction of rated insulation voltage to  $0,93 \times U_i$
- Reduction of load current to  $0,93 \times I_e$

Site altitude 3000 m above sea level:

- Reduction of rated insulation voltage to  $0,88 \times U_i$
- Reduction of load current to  $0,9 \times I_e$

Site altitude 4000 m above sea level:

- Reduction of rated insulation voltage to  $0,79 \times U_i$
- Reduction of load current to  $0,8 \times I_e$

Site altitude 5000 m above sea level:

- Reduction of rated insulation voltage to  $0,75 \times U_i$
- Reduction of load current to  $0,7 \times I_e$

These ratings apply to a maximum ambient temperature of 40 °C (140 °F).

## General data

**Benefits**

- Considerable space savings thanks to a width of only 22.5 mm
- Variety of connection techniques: screw connection, spring-type connection or ring terminal end, makes for easy terminations
- Flexible for a wide range of applications with function modules for retrofitting
- Possibility of fuseless short-circuit resistant design

**Advantages:**

- Saves time and costs with easy wiring, simple installation and fast commissioning
- Extremely long life, low maintenance, rugged and reliable
- Space-saving and safe thanks to side-by-side mounting up to an ambient temperature of +60 °C
- Modular design: standardized function modules and heat sinks can be used in conjunction with 22.5 mm style semiconductor relays to satisfy unique application requirements
- Vibration-resistant and shock-resistant spring-loaded terminal connection system provides a superior connection even under tough conditions

**Area of application****Applications****Solid-state relays**

SIRIUS solid-state relays are suitable for surface mounting on existing cooling surfaces. Installation is quick and easy, involving just two screws. The special technology of the power semiconductor ensures there is excellent thermal contact with the heat sink. Depending on the nature of the heat sink, the capacity reaches up to 88 A on resistive loads.

The solid-state relays are available in three different versions:

- 3RF21 single-phase solid-state relay with a width of 22.5 mm
- 3RF20 single-phase solid-state relay with a width of 45 mm
- 3RF22 three-phase solid-state relay with a width of 45 mm

The 3RF21 and 3RF22 solid-state relays can be expanded with various function modules to adapt them to individual applications.

**Solid-state contactors**

The complete units consist of a solid-state relay plus optimized heat sink, and are therefore ready to use. They offer defined rated currents to make selection as easy as possible. Depending on the version, current intensities of up to 88 A are achieved. Like all of our solid-state switching devices, one of their particular advantages is their compact and space-saving design.

With their insulated mounting foot they can easily be snapped onto a standard mounting rail, or they can be mounted on carrier plates with fixing screws. This insulation enables them to be used in circuits with protective extra-low voltage (PELV) or safety extra-low voltage (SELV) in building engineering. For other applications, such as for extended personal safety, the heat sink can be grounded through a screw terminal.

The solid-state contactors are available in two different versions:

- 3RF23 single-phase solid-state contactors
- 3RF24 three-phase solid-state contactors

**3RF22 three-phase solid-state relay with a width of 45 mm**

With its compact design, which stays the same even at currents of up to 55 A, the 3RF22 solid-state relay is the ultimate in space-saving construction, at a width of 45 mm. Installation on cooling surfaces is quick and easy, involving just two screws. The logical connection arrangement, with the power infeed from above and connection of the load from below, ensures tidy installation in the control cabinet.

**3RF24 three-phase solid-state contactors**

The compact design enables small compact units with currents up to 50 A. All special features of the solid-state relays for saving time and space are effective here too.

**Example plastic machine industry:**

Thanks to their high switching endurance, SIRIUS SC semiconductor switching devices are ideally suited for use in the control of electroheat. This is because the more precise the temperature regulation process has to be, the higher the switching frequency needs to be. The accurate regulation of electroheat is used for example in many processes in the plastic machine industry:

- Band heaters heat the extrudate to the correct temperature in plastic extruders
- Heat emitters heat plastic blanks to the correct temperature
- Heat drums dry plastic granules
- Heating channels keep molds at the correct temperature in order to manufacture different plastic parts without defects.

The powerful SIRIUS SC semiconductor relays and contactors can be used to control several heating loads at the same time. By using a load monitoring module the individual partial loads can easily be monitored, and in the event of a failure a signal is generated which can be sent to the controller.

**Protecting the semiconductor relays and semiconductor contactors with 5 SY supplemental protectors.**

Short-circuit protection and line protection with 5 SY supplemental protectors is easy to achieve with SIRIUS SC semiconductor relays and semiconductor contactors in comparison with designing load feeders with fuses. A special version of the semiconductor contactors can be protected against damage in the case of a short-circuit with 5 SY supplementary protector with type B tripping characteristic. This allows the low-cost and simple design of fuseless load feeders with full protection of the switching device.

**Design**

There is no typical design of a load feeder with semiconductor relays or semiconductor contactors; instead, the great variety of connection systems and control voltages offers universal application opportunities. SIRIUS SC semiconductor relays and semiconductor contactors can be installed in fuseless or fused feeders, as required.

There are special versions with which it is even possible to achieve short-circuit strength in a fuseless design.

**Mounting regulations**

Distances for stand-alone installation

## Functions

### Connection

All SIRIUS SC semiconductor switching devices are characterized by the great variety of connection methods. You can choose between the following connection techniques:

#### SIGUT connection system (screw)

The SIGUT connection system is the standard among industrial switching devices. Open terminals and a plus-minus screw are just two features of this technology. Two conductors of up to  $6 \text{ mm}^2$ <sup>1)</sup> can be connected in just one terminal. As a result, loads of up to 50 A can be connected.

#### Spring-loaded connection system

This innovative technology holds the conductor without screw connection. This means that very high vibration resistance is achieved. Two conductors of up to  $2.5 \text{ mm}^2$ <sup>1)</sup> can be connected to each terminal. As a result, loads of up to 20 A can be dealt with.

#### Ring terminal end connection

The ring terminal end connection is equipped with an M5 screw. Ring terminal ends of up to  $25 \text{ mm}^2$  can be connected. In this way it is possible to connect conductors with up to 88 A safely. Additional finger safety can be provided with a special cover.

### Switching types

In order to guarantee an optimized control method for different loads, the functionality of our semiconductor switching devices can be adapted accordingly.

The "**zero-point switching**" method is ideal for resistive loads, i.e. where the power semiconductor is activated at zero voltage.

For inductive loads, on the other hand, for example in the case of valves, it is better to go with "**instantaneous switching**". By distributing the ON point over the entire sine curve of the mains voltage, disturbances are reduced to a minimum.

A special "low noise" version is available due to a special control, this special version can be used in public networks up to 16A without any additional measures such as interference suppressor filters. As a result, it conforms to limit value curve class B according to EN 60947-4-3 in terms of emitted interference.

## Function

### Two-phase controlled version

In many three-phase applications there is no need of a three-phase controller. Loads in a delta circuit or wye circuit, which have no connection to the neutral conductor, can be safely switched on and off using only two phases.

Nevertheless, the 3RF22 and 3RF24 three-phase solid-state switching devices provide the possibility of connecting all three phases to the switching device, with the middle phase looped directly through the device. Thanks to the lower power loss compared to a three-phase controlled device it is possible for the mounted accessories to be more compact.

### Three-phase controlled version

This version is used in three-phase applications which have to switch all phases on and off for system reasons or in the case of loads in a wye circuit with connection to the neutral conductor.

## Performance characteristics

The performance of the semiconductor switching devices are substantially determined by the type of power semiconductors used and the internal design. In the case of the SIRIUS SC semiconductor contactors and semiconductor relays, only thyristors are used instead of less powerful Triacs.

Two of the most important features of thyristors are the blocking voltage and the maximum load integral:

#### Blocking voltage

Thyristors with a high blocking voltage can also be operated without difficulty in power systems with high interference voltages. Separate protective measures, such as a protective circuit with a varistor, are not necessary in most cases.

With SIRIUS SC, for example, thyristors with 800 V blocking voltage are fitted for operation in power systems up to 230 V. Thyristors with up to 1600 V are used for power systems with higher voltages.

#### Maximum load integral

One of the purposes of specifying the maximum load integral ( $Pt$ ) is to determine the rating of the short-circuit protection. Only a large power semiconductor with a correspondingly high  $Pt$  value can be given appropriate protection against destruction from a short-circuit by means of a protective device matched to the application. However, SIRIUS SC is also characterized by the optimum matching of the thyristors ( $Pt$  value) with the rated currents. The rated currents specified on the devices in conformance with EN 60947-4-3 were confirmed by extensive testing.

1) For  $\text{mm}^2$  to AWG conversion see page 19/21 of Industrial Controls catalog.

## Integration

**Notes on integration in the load feeders**

The SIRIUS solid-state switching devices are very easy to integrate into the load feeders thanks to their industrial connection method and design.

Particular attention must however be paid to the circumstances of the installation and ambient conditions, as the performance of the solid-state switching devices is largely dependent on these. Depending on the version, certain restrictions must be observed. Detailed information, for example in relation to solid-state contactors about the minimum spacing and to solid-state relays about the choice of heat sink, is given in the technical specifications (see [Technical Information LV 1 T](#) or our [Mall](#)) and the product data sheets.

Despite the rugged power semiconductors that are used, solid-state switching devices respond more sensitively to short-circuits in the load feeder. Consequently, special precautions have to be taken against destruction, depending on the type of design.

Siemens generally recommends using SITOR semiconductor protection fuses. These fuses also provide protection against destruction in the event of a short-circuit even when the solid-state contactors and solid-state relays are fully utilized.

Alternatively, if there is lower loading, protection can also be provided by standard fuses or miniature circuit breakers. This protection is achieved by overdimensioning the solid-state switching devices accordingly. The technical specifications and the product data sheets contain details both about the solid-state fuse protection itself and about use of the devices with conventional protection equipment.

Semiconductor motor and reversing contactors can be easily combined with the 3RV motor starter protectors and 3RB2 overload relay from the SIRIUS modular system. Thus, fuseless and fuse motor feeders can be designed easily and in a space-saving manner.

The solid-state switching devices for resistive loads are suitable for interference-free operation in industrial networks without further measures. If they are used in public networks, it may be necessary for conducted interference to be reduced by means of filters. This does not include the special solid-state contactors of type 3RF23...-CA.. "Low Noise". These comply with the class B limit values up to a rated current of 16 A. If other versions are used, and at currents of over 16 A, standard filters can be used in order to comply with the limit values. The decisive factors when it comes to selecting the filters are essentially the current loading and the other parameters (operational voltage, design type, etc.) in the load feeder.

Suitable filters can be ordered from EPCOS AG.

# Solid-State Relays

## 45 mm semiconductor relays

### Fused design with semiconductor protection (similar to type of coordination "2")<sup>1)</sup>

The semiconductor protection for the SIRIUS SC control gear can be used with different protective devices. This allows protection by means of LV HRC fuses of operational class gL/gG or supplementary protectors. The table on page 7/21 lists the maximum permissible fuses for each SIRIUS SC controlgear.

If a fuse is used with a higher rated current than specified, semiconductor protection is no longer guaranteed. However, smaller fuses with a lower rated current for the load can be used without problems.

For protective devices with operational class gL/gG and for SITOR full range fuses 3NE1, the minimum cross-sections for the conductor to be connected must be taken into account.

# Solid-State Relays

## 3RF22 solid-state relays, 3-phase, 45 mm

### Selection and ordering data

#### Selecting solid-state relays

When selecting solid-state relays, in addition to information about the power system, the load and the ambient conditions it is also necessary to know details of the planned design. The solid-state relays can only conform to their specific technical specifications if they are mounted with appropriate care on an adequately dimensioned heat sink. The following procedure is recommended:

- Determine the rated current of the load and the mains voltage
- Select the relay design and choose a solid-state relay with higher rated current than the load
- Determine the thermal resistance of the proposed heat sink
- Check the correct relay size with the aid of the diagrams.

2) Please note that the version with an M4 screw terminal can only be used for a rated current of up to approx. 50 A and a conductor cross-section of 10 mm<sup>2</sup>.

3) Please note that this version can only be used for a rated current of up to approx. 20 A and a conductor cross-section of 2.5 mm<sup>2</sup>.

## Solid-State Contactors

## General data

## Overview

## Solid-state contactors

The complete units consist of a solid-state relay plus optimized heat sink, and are therefore ready to use. They offer defined rated currents to make selection as easy as possible. Depending on the version, current strengths of up to 88 A are achieved. Like all of our solid-state switching devices, one of their particular advantages is their compact and space-saving design.

With their insulated mounting foot they can easily be snapped onto a standard mounting rail, or they can be mounted on support plates with fixing screws. This insulation enables them to be used in circuits with protective extra-low voltage (PELV) or safety extra-low voltage (SELV) in building management systems. For other applications, such as for extended personal safety, the heat sink can be grounded through a screw terminal.

The solid-state contactors are available in 2 different versions:

- 3RF23 single-phase solid-state contactors,
- 3RF24 three-phase solid-state contactors

## Single-phase versions

The 3RF23 solid-state contactors can be expanded with various function modules to adapt them to individual applications.

## Version for resistive loads, "zero-point switching"

This standard version is often used for switching space heaters on and off.

## Version for inductive loads, "instantaneous switching"

In this version the solid-state contactor is specifically matched to inductive loads. Whether it is a matter of frequent actuation of the valves in a filling plant or starting and stopping small operating mechanisms in packet distribution systems, operation is carried out safely and noiselessly.

## Special "Low noise" version

Thanks to a special control circuit, this special version can be used in public networks up to 16 A without any additional measures such as interference suppressor filters. As a result it conforms to limit value curve class B according to EN 60947-4-3 in terms of emitted interference.

## Special "Short-circuit-proof" version

Skilful matching of the power semiconductor with the performance capacity of the solid-state contactor means that "short-circuit strength" can be achieved with a standard miniature circuit breaker. In combination with a B-type MCB or a conventional line protection fuse, the result is a short-circuit resistant feeder.

In order to achieve problem-free short-circuit protection by means of miniature circuit breakers, however, certain boundary conditions must be observed. As the magnitude and duration of the short-circuit current are determined not only by the short-circuit breaking response of the miniature circuit breaker but also the properties of the wiring system, such as the internal resistance of the input to the network and damping by controls and cables, particular attention must also be paid to these parameters. The necessary cable lengths are therefore shown for the main factor, the line resistance, in the table above right.

The following miniature circuit breakers with a type B tripping characteristic and 10 kA or 6 kA breaking capacity protect the 3RF23...DA.. solid-state contactors in the event of short-circuits on the load and the specified conductor cross-sections and lengths:

Rated current of the miniature circuit breaker	Example Type <sup>1)</sup>	Max. conductor cross-section	Minimum cable length from contactor to load
6 A	5SY4 106-6, 5SX2 106-6	1 mm <sup>2</sup>	5 m
10 A	5SY4 110-6, 5SX2 110-6	1.5 mm <sup>2</sup>	8 m
16 A	5SY4 116-6, 5SX2 116-6	1.5 mm <sup>2</sup>	12 m
16 A	5SY4 116-6, 5SX2 116-6	2.5 mm <sup>2</sup>	20 m
20 A	5SY4 120-6, 5SX2 120-6	2.5 mm <sup>2</sup>	20 m
25 A	5SY4 125-6, 5SX2 125-6	2.5 mm <sup>2</sup>	26 m

1) The miniature circuit breakers can be used up to a maximum rated voltage of 480 V!

The setup and installation above can also be used for the solid-state relays with a  $I^2t$  value of at least 6600 A<sup>2</sup>s.

## Three-phase versions

The three-phase solid-state contactors for resistive loads up to 50 A are available with

- two-phase control (suitable in particular for circuits without connection to the neutral conductor) and
- three-phase control (suitable for star circuits with connection to the neutral conductor or for applications in which the system requires all phases to be switched).

The converter function module can be snapped onto both versions for the simple power control of AC loads by means of analog signals.

- Check the correct contactor size with the aid of the rated current diagram, taking account of the design conditions.

# Solid-State Relays

## SIRIUS SC semiconductor contactors – single phase selection

### Selection and ordering data

#### Selecting solid-state contactors

The semiconductor contactors are selected on the basis of details of the power system, the load and the ambient conditions. As the semiconductor contactors are already equipped with an optimally matched heat sink, the selection process is considerably simpler than that for semiconductor relays.

The following procedure is recommended:

- Determine the rated current of the load and the mains voltage
- Select a semiconductor contactor with the same or higher rated current than the load
- Check the correct contactor size with the aid of the rated current diagram, taking account of the design conditions

Type current 1)	Maximum achievable power for $I_{max}$ and $U_e =$			Screw connection	Spring-loaded connection	Ring cable connection	Std. Pack Qty	Weight per pack approx.

# Solid-State Contactors for Switching Motors

## General data

### Overview

Solid-state contactor for direct-on-line starting

The solid-state contactors for switching motors are intended for frequently switching on and off three-phase current operating mechanisms up to 7.5 kW and reversing up to 3.0 kW. The devices are constructed with complete insulation and can be mounted directly on SIRIUS motor starter protectors, overload relays and current monitoring relays, resulting in a very simple integration into motor feeders.

These three-phase solid-state contactors are equipped with a two-phase control which is particularly suitable for typical motor current circuits without connecting to the neutral conductor.

Important features:

- Insulated enclosure with integrated heat sink
- Degree of protection IP20
- Integrated mounting foot to snap on a standard mounting rail or for assembly onto a support plate
- Variety of connection methods
- Plug-in control connection
- Display via LEDs
- Wide voltage range for AC control supply voltage

### Switching functions

The solid-state contactors for switching motors are “instantaneous switching” because this method is particularly suited for inductive loads. By distributing the ON point over the entire sine curve of the mains voltage, disturbances are reduced to a minimum

### Selecting solid-state contactors

The solid-state contactors are selected on the basis of details of the network, the load and the ambient conditions.

The following procedure is recommended:

- Determine the rated current of the load and the mains voltage
- Select a solid-state contactor with the same or higher rated current than the load
- Testing the maximum permissible switching frequency based on the characteristic curves (see “Technical Information”). To do this, the starting current, the starting time and the motor loaded in the operating phase must be known.
- If the permissible switching frequency is under the desired frequency, it is possible to achieve an increase only by overdimensioning the motor and the solid-state contactor!

### Benefits

- Units with integrated heat sink, “ready to use”
- Compact and space-saving design
- Reversing contactors with integrated interlocking

### Application

#### Use in load feeders

There is no typical design of a load feeder with solid-state relays or solid-state contactors; instead, the great variety of connection methods and control voltages offers universal application opportunities. SIRIUS solid-state relays and solid-state contactors can be installed in fuseless or fused feeders, as required.

#### Standards and approvals

- IEC 60947-4-2
- UL 508, CSA for North America<sup>1)</sup>
- CE marking for Europe
- C-Tick approval for Australia
- CCC approval for China

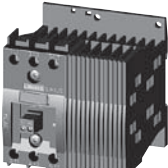

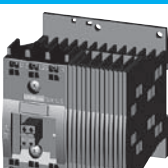

<sup>1)</sup> Please note: Use overvoltage protection device; max. cut-off-voltage 6000 V; min. energy handling capability 100 J.

# 3RF29 Function Modules

## Selection Tables

### Overview

#### Function modules for SIRIUS 3RF2 solid-state switching devices

A great variety of applications demand an expanded range of functionality. With our function modules, these requirements can be met really easily. The modules are mounted simply by clicking them into place; straight away the necessary connections are made with the solid-state relay or contactor. The plug-in connection to control the solid-state switching devices can simply remain in use.

The following function modules are available:

- Converters
- Load monitoring
- Heating current monitoring
- Power controllers
- Power regulators

With the exception of the converter, the function modules can be used only with single-phase solid-state switching devices.

#### Recommended assignment of the function modules to the 3RF21 single-phase solid-state relays

1) The use of power controllers/regulators is also possible on zero-point switching versions for full-wave control mode. The generalized phase control mode is recommended only for the combination with instantaneous switching versions.

### Overview

#### Converter for SIRIUS SC semiconductor switching devices

This module is used to convert analog drive signals, such as those output from many temperature controllers, for example, into a pulse-width-modulated digital signal. The connected semiconductor contactors and relays can therefore regulate the output of a load as a percentage.

### Area of application

The device is used for conversion from an analog input signal to an on/off ratio. The function module can only be used in conjunction with a 3RF21 semiconductor relay or a 3RF23 semiconductor contactor.

### Design

#### Mounting

Simply snapping onto the 3RF21 semiconductor relays or 3RF23 semiconductor contactors establishes the connections to the semiconductor switching devices. The connector on the semiconductor switching devices from the control circuit can be used on the converter without rewiring.

### Functions

The analog value from a temperature controller is present at the 0–10 V terminals. This controls the on-to-off period, as a function of voltage. The period duration is predefined at one second. Conversion of the analog voltage is linear in the voltage range from 0.1 to 9.9 V. At voltages below 0.1 V the connected switching device is not activated, while at voltages above 9.9 V the connected switching device is always activated.

## Function Modules

## Load monitoring

## Overview

**Load monitoring for SIRIUS SC semiconductor switching devices**

With the addition of the load monitoring module many faults can be quickly detected by monitoring a load circuit connected to the semiconductor switching device. Examples include the failure of load elements (up to 6 in the basic version or up to 12 in the extended version), alloyed power semiconductors, a lack of voltage or a break in a load circuit. A fault is indicated by one or more LEDs and reported to the controller via a PLC-compatible output.

The operating principle is based on monitoring of the current. This figure is continuously compared with the reference value stored once during commissioning by the simple press of a button. In order to detect the failure of one of several loads, the current decrease must be 1/6 (in the basic version) or 1/12 (in the extended version) of the reference value. In the event of a fault, a contact (NC) is actuated and one or more LEDs indicate the fault.

## Area of application

The device is used for monitoring one or more loads (partial loads). The function module can only be used in conjunction with a 3RF21 semiconductor relay or a 3RF23 semiconductor contactor. The devices with spring-loaded connections in the load circuit are not suitable for use with load monitoring modules.

## Design

## Mounting

Simply snapping the load monitoring module onto the 3RF21 semiconductor relays or 3RF23 semiconductor contactors establishes the control connections to the semiconductor switching devices. Because of the special design, the straight-through transformer of the load monitoring module covers the lower main power connection. The cable to the load is simply pushed through and secured with the terminal screw.

## Functions

The function module is activated when an "ON" signal is applied (IN terminal). The module constantly monitors the current level and compares this with the setpoint value.

## Start-up

Pressing the "Teach" button switches the device on; the current through the semiconductor switching device is measured and is stored as the setpoint. During this process the two lower (red<sup>1)</sup>) LEDs flash alternately; simultaneous maintained light from the 3 (red<sup>1)</sup>) LEDs indicates the conclusion of the teaching process.

The "Teach" button can also be used to switch on the connected semiconductor switching device briefly for test purposes. In this case the "ON" LED is switched on.

**Partial load faults, "basic" load monitoring**

If a decrease of at least 1/6 of the stored setpoint value is detected, a fault is signaled. The fault is indicated via a "Fault" LED and by activation of the fault signaling output.

LEDs	OK	Fault		
		Partial load failure/ load short-circuit	Thyristor defect	Mains failure/ fuse rupture
ON/OFF	✓	✓	-	✓
Current flowing	✓	✓	✓	-
Group fault	-	✓	✓	✓

✓ Function is available  
- Function not available

**Partial load faults, "extended" load monitoring**

Depending on the setting of the "response time" potentiometer, a decrease of at least 1/12 of the stored setpoint value after a response time of between 100 ms and 3 s is signaled as a fault. The fault is indicated via a "Load" LED and by activation of the fault signaling output.

The potentiometer can also be used to determine the response behavior of the fault signaling output. When delay values are set in the left-hand half, the fault signal is stored. This can only be reset by switching on and off by means of the control supply voltage.

When settings are made on the right-hand side, the fault output is automatically reset after the deviation has been corrected.

**Voltage compensation, "extended" load monitoring**

In addition to the current, the load voltage is also monitored. This makes it possible to compensate for influences on the current strength resulting from voltage fluctuations.

**Thyristor fault**

If a current greater than the residual current of the switching device is measured in the deenergized state, the device triggers a thyristor fault after the set time delay. This means that the fault output is activated and the "Fault" ("Thyristor"<sup>1)</sup>) LED lights up.

**Supply fault**

If no current is measured in the energized state, the device triggers a supply fault after the set time delay. This means that the fault output is activated and the "Fault" ("Supply"<sup>1)</sup>) LED lights up.

1) "Extended" load monitoring

## Heating current monitoring

### Overview

#### Heating current monitoring for 3RF2 single-phase solid-state switching devices

Many faults can be quickly detected by monitoring a load circuit connected to the solid-state switching device, as made possible with this module. Examples include the failure of up to 6 load elements, alloyed power semiconductors, a lack of voltage or a break in a load circuit. A fault is indicated by LEDs and reported to the controller by way of a relay output (NC contact).

The principle of operation is based on permanent monitoring of the current strength. This figure is continuously compared with the reference value stored once during start-up. In order to detect the failure of one of several loads, the current difference must be 1/6 of the reference value. In the event of a fault, an output is actuated and the LEDs indicate the fault.

The heating current monitoring has a teach input and therefore differs from the load monitoring. This remote teaching function enables simple adjustment to changing loads without manual intervention.

#### Special versions: deviations from the standard version

3RF29 ...0JA1.-1KK0

If the current is below 50 % of the lower teach current during the teach routine, the device will go into "Standby" mode; the LOAD LED will flicker. The device thus detects a non-connected load, e. g. channels not required for tool heaters, and does not signal a fault. This mode can be reset by re-teaching.

### Application

The device is used for monitoring one or more loads (partial loads). The function module can only be used in conjunction with a 3RF21 solid-state relay or a 3RF23 solid-state contactor. The devices with spring-loaded connections in the load circuit are not suitable.

# 3RF29 Function Modules

## Power controllers

### Overview

#### Power controllers for 3RF2 single-phase solid-state switching devices

The power controller is a function module for the autonomous power control of complex heating systems and inductive loads.

The following functions have been integrated:

- **Power controller** for adjusting the power of the connected load. Here, the setpoint value is set with a rotary knob on the module as a percentage with reference to the 100 % power stored as a setpoint value.
- **Inrush current limitation:** With the aid of an adjustable voltage ramp, the inrush current is limited by means of phase control. This is useful above all with loads such as lamps or infrared lamps which have an inrush transient current.
- **Load circuit monitoring** for detecting load failure, partial load faults, alloyed power semiconductors, lack of voltage or a break in the load circuit.

#### Special versions: deviations from the standard version

##### 3RF29 04-0KA13-0KC0

During the teaching process the connected solid-state relay or contactor is not activated; i. e. no current flow takes place. No current reference value is stored. No part-load monitoring!

##### 3RF29 ...0KA1.-0KT0

No part-load monitoring!

### Application

The power controller can be used for:

- Complex heating systems
- Inductive loads
- Loads with temperature-dependent resistor
- Loads with ageing after long-time service
- Simple indirect control of temperature

The power controller can be used on the instantaneously switching 3RF21 and 3RF23 solid-state switching devices (single-phase). If only the full-wave operating mode is used, the power controller can also be used on the "zero-point switching" solid-state relays and contactors.

#### Power control

The power controller adjusts the power in the connected load by means of a solid-state switching device depending on the setpoint selection. It does not compensate for changes in the mains voltage or load resistance. The setpoint value can be predefined externally as a 0 to 10 V signal or internally by means of a potentiometer. Depending on the setting of the potentiometer ( $t_p$ ), the control is carried out according to the principle of full-wave control or generalized phase control.

#### Full-wave control

In this operating mode the output is adjusted to the required setpoint value changing the on-to-off period. The period duration is predefined at one second.

#### Generalized phase control

In this operating mode the output is adjusted to the required setpoint value by changing the current flow angle. In order to observe the limit values of the conducted interference voltage for industrial networks, the load circuit must include a reactor with a rating of at least 200  $\mu$ H.

## Overview

### Power controllers for SIRIUS SC semiconductor switching devices

This module provides similar functionality to a power control regulator.

The following functions are integrated:

**Power control regulator with proportional-action control** for adjusting the power of the connected load. Here, the setpoint is set with a rotary knob on the module as a percentage with reference to the 100% power stored as a setpoint. In this way the power is kept constant even in the event of voltage fluctuations or a change in load resistance.

**Inrush current limitation:** With the aid of an adjustable voltage ramp, the inrush current is limited by means of phase control. This is useful above all with loads such as lamps which have an inrush transient current.

**Load circuit monitoring** for detecting load failure, alloyed power semiconductors, lack of voltage or a break in the load circuit.

## Area of application

The power controller adjusts the current in the connected load by means of a semiconductor switching device depending on a setpoint. This compensates for changes in the mains voltage or in the load resistance. The setpoint can be predefined externally as a 0 to 10 V signal or internally by means of a potentiometer. Depending on the setting of the potentiometer ( $t_R$ ), the adjustment is carried out according to the principle of full-wave control or generalized phase control.

### Full-wave control

In this operating mode the output is adjusted to the required setpoint by changing the on-to-off period. The period duration is predefined at one second.

### Generalized phase control

In this operating mode the output is adjusted to the required setpoint by changing the current flow angle. In order to observe the limit values of the conducted interference voltage for industrial power systems, a choke rated at at least 200  $\mu$ H must be included in the load circuit.

## Design

### Mounting

Easy snapping onto the 3RF21 semiconductor relays or 3RF23 semiconductor contactors establishes the connections to the semiconductor switching devices. Because of the special design, the straight-through transformer of the power controller module covers the lower main power connection. The cable to the load is simply pushed through and secured with the terminal screw.

1) Optional sealable cover - 3RF29 00-ORA88 can be used.

## Functions

### Start-up

Pressing the "Teach" button switches the device on; the current through the semiconductor switching device and the mains voltage are detected and stored. The resultant output is taken as the 100% output for the setpoint selection. During this process the two lower red LEDs flash alternately. Simultaneous maintained light from the three red LEDs indicates the completion of the "Teach" process.

The "Teach" button can also be used to switch on the connected semiconductor switching device briefly for test purposes. In this case the "ON" LED is switched on.

### Setpoint selection

The setting on the setpoint potentiometer (P) determines how the setpoint selection is to be made:

#### External setpoint selection

At 0 % the setpoint selection is set via an external 0 – 10 V analog signal (terminals IN / 0 – 10 V). The device is switched on and off via the power supply (terminals A1 / A2).

#### Internal setpoint selection

Above 0 % the setpoint is set using the potentiometer. To allow this, the potential at terminal A1 must additionally be applied at the IN terminal. After removal of the "ON" signal, the switching module is switched off.

#### Inrush current limitation

The ramp time ( $t_R$ ) for a voltage ramp on switching on is set with the potentiometer for the purpose of inrush current limitation. If a time longer than 0 s is set, the device operates according to the phase-angle principle. If 0 s is set, there is no voltage ramp and the device operates according to the principle of full-wave control.

### Load fault

If upon switching on with voltage applied the current flowing is not greater than the residual current of the switching device, the device triggers a load fault. The fault relay is activated and the "Load" LED lights up.

### Thyristor fault

If a current greater than the residual current of the switching device is measured in the deenergized state, the device triggers a thyristor fault. The fault relay is activated and the "Thyristor" LED lights up.

### Supply fault

If no current is measured in the energized state, the device triggers a supply fault. The fault relay is activated and the "Supply" LED lights up.

**Overview****Power control regulators for SIRIUS solid-state switching devices**

The power control regulator is a function module for the autonomous power control regulation of complex heating systems and inductive loads, for the operation of loads with temperature-dependent resistors or long-term aging, and for simple indirect temperature control.

The power control regulator can be used on the 3RF21 and 3RF23 instantaneous switching solid-state switching devices (single-phase). If only the full-wave control mode is used, the power control regulator can also be used on the zero-point-switching solid-state relays and contactors.

**Application**

The power control regulator sets the load current of the solid-state switching device depending on a setpoint value as a percentage. Changes in the mains voltage or in the load resistance are not compensated in this case. The modulation, the On/off ratio or the phase angle, remains unchanged in accordance with the setpoint. The autonomous power control regulation is performed between 0 and 100 % of the setpoint value

**Full-wave control**

If the left potentiometer  $t_R$  is set to 0 s (= far left), the power control regulator works according to the principle of full-wave control. The power set, be it internal or external, is converted into a pulse-width-modulated digital signal. The power control regulator controls the On and Off time of the solid-state switching device within a fixed period duration of 1 s so that the specified power is applied to the load. The "ON" LED flashes in the same rhythm as the solid-state switching device switches on and off.

**Generalized phase control**

If the left potentiometer  $t_R$  is set to higher than 0 s, the power control regulator works according to the principle of generalized phase control. With generalized phase control, a choke rated at at least 200  $\mu\text{H}$  must be included in the load circuit in order to observe the limit values of the conducted interference voltage for industrial networks.

**Design****Mounting**

Easy snapping onto the 3RF21 solid-state relays or 3RF23 solid-state contactors establishes the connections to the solid-state switching devices. Because of the special design, the straight-through transformer of the function module covers the lower main power connection. The cable to the load is simply pushed through and secured with the terminal screw.

**Function****Setpoint selection**

The setpoint is selected either internally using the right-hand potentiometer P with 0 ... 100 % on the module or externally through the analog input 0 ... 10 V.

100 % corresponds in full-wave control to permanently On and in generalized phase control to a conduction angle of 180° and hence maximum power.

When the setpoint is selected internally the module is controlled through the IN terminal. The terminal 10 then has no function.

Input characteristic curve

When the setpoint is selected externally (potentiometer P set far left = 0 %) the module is controlled by applying the analog voltage 0 ... 10 V. 0 ... 10 V corresponds to 0 ... 100 % power. Conversion of the voltage is linear between 0.1 and 9.9 V. Below 0.1 V the switching device remains off; at voltages above 9.9 V the power is always set to 100 %.

**Inrush current limitation**

The ramp time ( $t_R$ ) for a voltage ramp on switching on is set with the left potentiometer for the purpose of inrush current limitation. The set time refers to a power of 100 %. If, for example, a ramp time of 10 s is set and the selected power is 60 %, then a power of 60 % is reached after approx. 6 s.

**Line and thyristor monitoring**

The power control regulator recognizes supply failures and thyristor faults. The faults are indicated by the LEDs on the module and the fault output is activated.

## Solid-State Relays

## 3RF21 Solid-state relays – technical data

## Overview

## 22.5 mm semiconductor relays

With its compact design, which stays the same even at currents of up to 88 A, the 3RF21 semiconductor relay is the ultimate in space-saving construction, at a width of 22.5 mm. The logical connection arrangement, with the power infeed from above and connection of the load from below, ensures clean installation in the control cabinet.

## Solid-State Relays

## 3RF21 solid-state relays – technical data

**Fused version with semiconductor protection (similar to type of coordination "2")<sup>1)</sup>**

The semiconductor protection for the SIRIUS controls can be used with different protective devices. This allows protection by means of LV HRC fuses of gG operational class or miniature circuit breakers. Siemens recommends the use of special SITOR semiconductor fuses. The table below lists the maximum permissible fuses for each SIRIUS control.

If a fuse is used with a higher rated current than specified, semiconductor protection is no longer guaranteed. However, smaller fuses with a lower rated current for the load can be used without problems.

For protective devices with gG operational class and for SITOR 3NE1 all-range fuses, the minimum cross-sections for the conductor to be connected must be taken into account.

Suitable fuse holders, fuse bases and controls can be found in Catalog LV 1, Chapter 19.

- <sup>1)</sup> Type of coordination "2" according to EN 60947-4-1:  
In the event of a short-circuit, the controls in the load feeder must not endanger persons or the installation. They must be suitable for further operation. For fused configurations, the protective device must be replaced.
- <sup>2)</sup> For use only with operational voltage  $U_o$  up to 400 V.
- <sup>3)</sup> For use only with operational voltage  $U_o$  up to 506 V.
- <sup>4)</sup> These fuses have a smaller rated current than the solid-state relays.
- <sup>5)</sup> These versions can also be protected against short-circuits with miniature circuit breakers as described in the notes on "SIRIUS Solid-State Contactors → Special Version Short-Circuit Resistant".

## Solid-State Relays

## 3RF20 Solid-state relays – technical data

## Overview

## 45 mm semiconductor relays

The semiconductor relays with a width of 45 mm provide for connection of the power supply lead and the load from above. This makes it easy to retrofit existing semiconductor relays. The connection of the control cable also saves space in much the same way as the 22.5 mm design, as it is simply plugged on.

1) Type of coordination "2" acc. to EN 60947-4-1:  
In the event of a short-circuit, the control gear in the load feeder must not endanger persons or the installation. They must be suitable for further operation. For fused configurations, the protective device must be replaced.

2) These versions can also be protected against short-circuit with miniature circuit-breakers as described on page 7/11.

## Solid-State Relays

## 3RF22 Solid-state relays – technical data

## Overview

## 45 mm solid-state relays

The 3RF22 solid-state relays with a width of 45 mm provide space advantages over solutions with single-phase versions. The logical connection arrangement, with the power infeed from above and connection of the load from below, ensures tidy installation in the control cabinet.

Important features:

- LED indicators
- Variety of connection techniques
- Plug-in control connection
- Degree of protection IP20
- Zero-point switching,
- Two or three-phase controlled

## Solid-State Contactors

## 3RF23 Solid-state contactors – technical data

**Fused design with semiconductor protection  
(similar to type of coordination "2")<sup>1)</sup>**

The semiconductor protection for the SIRIUS SC controlgear can be used with different protective devices. This allows protection by means of LV HRC fuses of operational class gL/gG or supplementary protectors. Siemens recommends the use of special SITOR semiconductor fuses. The table below lists the maximum permissible fuses for each SIRIUS SC control gear.

If a fuse is used with a higher rated current than specified, semiconductor protection is no longer guaranteed. However, smaller fuses with a lower rated current for the load can be used without problems.

For protective devices with operational class gL/gG and for SITOR full range fuses 3NE1, the minimum cross-sections for the conductor to be connected must be taken into account.

1) Type of coordination "2" acc. to EN 60947-4-1:

In the event of a short-circuit, the controlgear in the load feeder must not endanger persons or the installation. They must be suitable for further operation. For fused configurations, the protective device must be replaced.

## Solid-State Contactors

## 3RF24 Solid-state contactors – technical data

## Overview

The complete units consist of a solid-state relay plus optimized heat sink, and are therefore ready to use. They offer defined rated currents to make selection as easy as possible. Depending on the version, current intensities of up to 50 A are achieved. Like all of our solid-state switching devices, one of their particular advantages is their compact and space-saving design. With their insulated mounting foot they can easily be snapped onto a standard mounting rail, or they can be mounted on carrier plates with fixing screws. This insulation enables them to be used in

circuits with protective extra-low voltage (PELV) or safety extra-low voltage (SELV) in building engineering. For other applications, such as for extended personal safety, the heat sink can be grounded through a screw terminal.

**Version for resistive loads, "zero-point switching"**

This standard version is often used for switching space heaters on and off.

<sup>1)</sup> These products were built as Class A devices. The use of these devices in residential areas could result in radio interference. In this case these may be required to introduce additional interference suppression measures.

<sup>2)</sup> The following applies for reversing contactors: To maintain the values, a 3TX7 462-3L surge suppressor (see "3TB Contactors", Chapter 3) should be used between the phases L1 and L3 as close as possible to the reversing contactor.

<sup>3)</sup> If two different conductor cross-sections are connected to one clamping point, both cross-sections must lie in one of the ranges specified.

## Solid-State Contactors

## 3RF34 Solid-state contactors – technical data

## Overview

These two-phase controlled, instantaneous switching solid-state contactors in the insulating enclosure are offered in 45 mm width to 5.2 A – and in 90 mm width to 16 A. This means that it is possible to operate motors up to 7.5 kW.

## Solid-State Contactors

## 3RF34 Solid-state reversing contactors – technical data

## Overview

The integration of four conducting paths to a reverse switch, combined in one enclosure makes this device a particularly compact solution. Compared to conventional systems, for which two contactors are required, it is possible to save up to 50 %

width with the three-phase reversing contactors. Devices with 45 mm width cover motors up to 2.2 kW – and those with 90 mm width up to 3 kW.

## Technical specifications

Type		3RF34 03-.BD.4	3RF34 05-.BD.4	3RF34 10-.BD.4
<b>Fuseless design with 3RV2 motor starter protector, CLASS 10</b>				
<b>Rated operational current <math>I_{AC-53}</math><sup>1)</sup></b> according to IEC 60947-4-2				
• At 40 °C	A	3.8 (3.4)	5.4 (4.8)	7.4
• UL/CSA, at 50 °C	A	3.5 (3.1)	5 (4.3)	6.8
• At 60 °C	A	3.2 (2.8)	4.6 (3.8)	6.2
<b>Power loss at <math>I_{AC-53}</math></b>				
• At 40 °C	W	7 (6)	9 (8)	13
<b>Short-circuit protection with type of coordination "1"</b> at an operational voltage of $U_0$ to 440 V				
• Motor starter protector, type		3RV20 11-1FA10	3RV20 11-1GA10	3RV20 11-1JA10
• Current $I_q$	kA	50	50	10

<sup>1)</sup> The reduced values in brackets apply to a directly mounted circuit breaker and simultaneous butt-mounting.

Type		3RF34 03-.BD.4	3RF34 05-.BD.4	3RF34 10-.BD.4
<b>Fused design with directly connected 3RB3 overload relay</b>				
<b>Rated operational current <math>I_{AC-53}</math></b> according to IEC 60947-4-2				
• At 40 °C	A	3.8	5.4	7.4
• UL/CSA, at 50 °C	A	3.5	5	6.8
• At 60 °C	A	3.2	4.6	6.2
<b>Power loss at <math>I_{AC-53}</math></b>				
• At 40 °C	W	6	8	16
<b>Minimum load current</b>	A	0.5		
<b>Max. off-state current</b>	mA	10		
<b>Rated peak withstand current <math>I_{ISM}</math></b>	A	200	600	
<b><math>I^2t</math> value</b>	A <sup>2</sup> s	200	1800	

Type		3RF34 ...-BD.4		
<b>Main circuit</b>				
<b>Controlled phases</b>		2-phase		
<b>Rated operational voltage <math>U_0</math><sup>1)</sup></b>	V AC	48 ... 480		
• Operating range	V AC	40 ... 506		
• Rated frequency	Hz	50/60 ± 10 %		
<b>Rated insulation voltage <math>U_i</math></b>	V	600		
<b>Rated impulse withstand voltage <math>U_{imp}</math></b>	kV	6		
<b>Blocking voltage</b>	V	1 200		
<b>Rate of voltage rise</b>	V/μs	1 000		

<sup>1)</sup> To reduce the risk of a phase short circuit due to overvoltage, we recommend using a varistor type 3TX7 462-3L between the phases L1 and L3 and as close as possible to the switchgear.

We recommend a design with semiconductor protection as short-circuit protection.

# Solid-State Contactors

## 3RF34 Solid-state reversing contactors – technical data

Type	3RF34 ...-BD0.	3RF34 ...-BD2.
<b>Control circuits</b>		
<b>Method of operation</b>	DC operation	AC operation
<b>Rated control supply voltage <math>U_s</math></b>	V 24 acc. to IEC 61131-2	110 ... 230

## Overview

**Function modules for SIRIUS SC semiconductor switching devices**

A great variety of applications demand an expanded range of functionality. These applications can easily be met with Sirius SC function modules. The modules are mounted simply by clicking them into place; straight away the necessary connections are made with the semiconductor relay or contactor.

The plug-in connection to control the semiconductor switching devices can simply remain in use.

The following function modules are available:

- Converter
- Load monitors (basic and enhanced)
- Power controller

# Semiconductor Relays and Contactors, Function Modules

## Project planning aids

### Characteristics

#### SIRIUS SC semiconductor relays

Dependence of the device current  $I_e$  on the ambient temperature  $T_a$  (Chart data for SIRIUS SC relays based on I max)

SIRIUS SC semiconductor relay with 20 A type current (3RF21 20/3RF20 20)<sup>1)</sup>

SIRIUS SC semiconductor relay with 30 A type current (3RF21 30/3RF20 30)

SIRIUS SC semiconductor relay with 50 A type current (3RF21 50/3RF20 50)

1) Arrangement example for  $I_e = 20$  A and  $T_a = 40$  C:  
The task is to find the thermal resistance  $R_{thha}$  and the heat-sink overtemperature  $dT_{ha}$ : From the diagram on the left  $\rightarrow P_M = 28$  W, from the diagram on the right  $\rightarrow R_{thha} = 1.7$  K/W.

This results in:  $dT_{ha} = R_{thha} \times P_M = 1.7$  K/W  $\times$  28 W = 47.6 K. At  $dT_{ha} = 47.6$  K the heat sink must therefore have an  $R_{thha} = 1.7$  K/W. (Chart data for SIRIUS SC relays based on I max)

Type current 55 A (3RF22 55-AB..)

# Solid-State Relays

3RF22 solid-state relays, 3-phase, 45 mm

## Dependence of the device current $I_e$ on the ambient temperature $T_a$ (three-phase controlled)

Type current 30 A (3RF22 30-.AC..)

Type current 55 A (3RF22 55-.AC..)

### Arrangement example

Given conditions:  $I_e = 55$  A and  $T_a = 40$  C.

The task is to find the thermal resistance  $R_{thha}$  and the heat sink overtemperature  $dT_{ha}$ .

From the diagram from the left  $\rightarrow P_M = 227$  W,  
from the diagram from the right  $\rightarrow R_{thha} = 0.09$  K/W.

This results in:

$$dT_{ha} = R_{thha} \times PM = 0.09 \text{ K/W} \times 227 \text{ W} = 20.4 \text{ K.}$$

At  $dT_{ha} = 20.4$  K the heat sink must therefore have an  $R_{thha} = 0.09$  K/W.

- 1) Internal connection.
- 2) Straight-through transformer.
- 3) PE/ground connection for semiconductor contactors according to installation regulations.
- 4) Connection of contact L/N to N conductor or a second phase according to the rated operational voltage of the function module.
- 5) In order to observe the limit values of the conducted interference voltage for generalized phase control, a choke rated at at least 200  $\mu$ H must be included in the load circuit.

- 1) Internal connection to the solid state relay/contactor.
- 2) Straight-through.
- 3) Make PE/ground connection according to installation regulations.
- 4) Connection of L/N contact with
  - 3RF29 ..-0GA.3 load monitoring on neutral conductor N (e.g. 230 V),
  - 3RF29 ..-0GA.6 load monitoring on a second phase (e.g. 400V).
- 5) Voltage detection not electrically isolated (3M $\Omega$  per path).
- 6) Grounding of connection L- is recommended.
- 7) A200  $\mu$ H choke must be used when operating with leading-edge phase in order to observe the limit values of the conducted interference voltage according to Class A.

## NEMA &amp; General Purpose Controls

## Controls Express

## Starters at the speed you need

Siemens NEMA starters, pump panels and lighting contactors are known for their dependability and ruggedness, and now they are delivered faster than ever before through Controls Express.

Controls Express puts our most popular products in your hands faster, because we stock more products across our entire product line. Our Class 14 NEMA starters, Class 87 pump panels, and LC & LE lighting contactors are now available in stock for immediate or next day shipping. In addition, thousands of our open and enclosed starters can now be built-to-order and shipped in 1-3 days through Controls Express.

Siemens is committed to making your job easier by stocking more products, offering more configurations, expediting factory modifications, and delivering industry leading turnaround times on our most requested control products.

To quickly identify products that are part of Controls Express and therefore available in 3 days or less, applicable catalog numbers have a light blue background. See the appropriate selection pages listed below.

**Class 14 NEMA Starters** see pages 9/13 & 9/15

**Class 17 NEMA Combination Starters** see pages 9/17 to 9/22. For quick ship versions with factory modifications see on-line at [www.usa.siemens.com/controls-express](http://www.usa.siemens.com/controls-express)

**Class 18 NEMA Combination Starters** see pages 9/23 & 9/25.

**Class 40 NEMA Contactors** see page 9/60

**Class 87 Pump Panels** see pages 9/78 & 9/79

**LE Lighting Contactors** see page 9/85

**LC Lighting Contactors** see page 9/91 & 9/92

Controls Express lead times apply to orders of up to 6 units of the Class 14, Class 87, LC, or LE. Please contact customer service at 1-866-663-7324 for lead times of larger order volumes.

For more information on Controls Express and a complete list of available products, please visit our website at [www.usa.siemens.com/controls-express](http://www.usa.siemens.com/controls-express)

# Fractional HP Starters, Class SMF

## General

### Class SMF

Class SMF fractional horsepower starters provide overload protection as well as manual on-off control for small horsepower motors in a variety of industrial and commercial applications. Available in one or two pole versions, these devices are suitable for use with AC single phase motors up to 1 HP. Two pole starters can also be used with DC motors up to ¾ HP. Typical applications include fans, conveyors, pumps, and small machine tools.

#### Continuous Current Rating

16 amperes.

#### Overload Trip Assembly

Motor protection is provided by a Class SMFH heater element which must be installed before the starter will operate.

#### Two Speed Starters

Two speed manual starters are designed for control of small single phase AC motors having separate windings for high and low speed operation. Two toggle operated starters are used, with overload protection included for each motor winding. Surface mounting devices, and those with a gray flush plate, utilize a mechanical interlock which allows direct control of the motor by means of the toggle operators.

### Enclosures

Class SMF, NEMA Type 1 surface mounting enclosures are sheet steel with a thermo-plastic wrap-around cover for convenience in wiring. The NEMA Type 1 enclosure is also available in an oversized version which allows more wiring space. A zinc alloy die casting is used for NEMA Type 4 enclosures.

### Pilot Lights

Red or green neon pilot light units are available for flush mounting plates, NEMA Type 1 enclosures, and NEMA Type 4 enclosures. Pilot lights may be either factory or field installed. (For starters that contain a pilot light, a Red light is standard. For a Green pilot light add "G" to the end of the catalog number.)

### Terminals

Binding head screw type terminals are suitable for #10 or smaller copper wire, and are accessible from the front. All terminals are clearly marked.

### Mounting

Open types without a pilot light fit standard single gang switch boxes, and can be used with any cover plate having a standard toggle cutout. Single-unit flush mounting types, including those with pilot lights, are suitable for wall mounting in a standard switch box or for machine cavity mounting without a box.

### Operation

Available with toggle handle or with removable key type operator to discourage unauthorized operation.

Class SMF Starter in a NEMA Type 1 Enclosure with Pilot Light

### Emergency Off Actuator

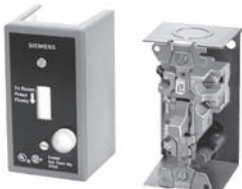

A toggle operator extender is available for Class SMF, NEMA Type 1 surface mounted units. The extender has a red vinyl button that provides a fast and easy method for locating and switching the device's toggle operator into the OFF position. The Emergency Off Actuator is available in kit form only for field installation.

### Handle Guard/Lock-Off

An optional handle guard on Class SMF, NEMA Type 1 enclosed starters prevents accidental operation of the toggle operator and also allows the toggle operator to be padlocked in either the "ON" or "OFF" position. This handle guard can be factory installed on NEMA Type 1 enclosed starters and is also available in kit form for field installation on NEMA Type 1 surface and flush mounting enclosures. Standard NEMA Type 4 metallic enclosures include provisions for padlocking the device in the OFF position.

① One heater element required.

② Furnished with (1) ¾" NPT Outlet in bottom (reversible for top feed).

③ Two heater elements required.

④ Order Open Type starter plus separate handle guard kit.

⑤ For starters that contain a pilot light, a Red light is standard. For a Green pilot light add "G" to the end of the catalog number.

# Fractional HP Switches, Class MMS, MRS

## General

### Class MMS, MRS

Class MMS and MRS motor starting switches provide manual "ON-OFF" control of single or three phase AC motors where overload protection is not required or is provided separately. Compact construction and a 600 volt rating make these switches suitable for a wide range of industrial and commercial uses. Typical applications include small machine tools, pumps, fans, conveyors and many other types of electrical machinery. They can also be used on non-motor loads such as resistance heating applications.

#### Continuous Current Rating

**MMS & MRS:** 30 amperes at 250 volts max, 26.4 amperes at 277 volts, 20 amperes at 600 volts max, 30 amperes resistive at 600 volts max.

#### Two Speed—Class MRS

Two speed manual switches may be used with separate winding three phase or single phase AC motors where overload protection is not required or is provided separately. Two switches are employed to give "ON-OFF" control in each speed.

#### Reversing—Class MRS

Reversing manual switches provide a compact means of starting, stopping and reversing AC motors where overload protection is not required or is provided separately. They are suitable for use with three phase squirrel cage motors and for single phase motors which can be reversed by reconnecting motor leads. Two switches are used, one to connect the motor forward rotation and one for reverse.

### Enclosures

Class MMS, MRS, NEMA Type 1 surface mounting enclosures are sheet steel with a thermo-plastic wrap-around cover for convenience in wiring. The NEMA Type 1 enclosure is also available in an oversized version which allows more wiring space. A zinc alloy die casting is used for NEMA Type 4 enclosures.

#### Pilot Lights

Red or green neon pilot light units are available for flush mounting plates, NEMA Type 1 enclosures, and NEMA Type 4 enclosures. Pilot lights may be either factory or field installed. (For switches that contain a pilot light, a Red light is standard. For a Green pilot light add "G" to the end of the catalog number.)

#### Terminals

Binding head screw type terminals are suitable for #10 or smaller copper wire, and are accessible from the front. All terminals are clearly marked.

#### Mounting

Open types without a pilot light fit standard single gang switch boxes, and can be used with any cover plate having a standard toggle cutout. Single-unit flush mounting types, including those with pilot lights, are suitable for wall mounting in a standard switch box or for machine cavity mounting without a box.

#### Operation

Available with toggle handle or with removable key type operator to discourage unauthorized operation.

Class MMS Switch in a NEMA Type 1 Enclosure

### Emergency Off Actuator

A toggle operator extender is available for Class MMS, MRS, NEMA Type 1 surface mounted units. The extender has a red vinyl button that provides a fast and easy method for locating and switching the device's toggle operator into the OFF position. The Emergency Off Actuator is available in kit form only for field installation.

#### Handle Guard/Lock-Off

An optional handle guard on Class MMS, MRS, NEMA Type 1 enclosed switches prevents accidental operation of the toggle operator and also allows the toggle operator to be padlocked in either the "ON" or "OFF" position. This handle guard is available in kit form for field installation on NEMA Type 1 surface and flush mounting enclosures. Standard NEMA Type 4 metallic enclosures include provisions for padlocking the device in the OFF position.

① Manual switches do not include overloads.

② Furnished with (1) 3/4" NPT outlet in bottom (reversible for top feed). In order to obtain a 3/4" NPT outlet in top and bottom, add suffix letter "H" to type number with List Price adder.

③ Do not use as replacement interiors for NEMA Type 4 metallic enclosures. For replacement unit, order Type MMSK01 or MMSK02 and separate pilot light kit.

④ For switches that contain a pilot light, a Red light is standard. For a Green pilot light add "G" to the end of the catalog number.

## Now Available with the New 3RV2 Innovations MSP

## Class 11 - 3RV

Class 11 across the line manual starters and switches provide control for machinery where remote start stop control is not required.

**Class 11 - 3RV** manual starters are used for single and poly-phase motors up to 20HP @ 575V. Starters have bimetallic heater elements to provide class 10 overcurrent protection. Each starter has a fourth bimetallic strip that reacts only to the ambient temperature inside the control panel. This ambient compensation helps prevent the starter from nuisance tripping when the panel temperature is higher than the ambient temperature of the motor.

A built-in differential trip bar causes the starter to trip faster on a phase loss condition to help reduce motor damage.

Magnetic trip elements in each starter take the device off line when it senses current of 13 times the maximum FLA dial setting.

**Class 11 - 3RV** switches provide control for inherently protected motors. Typical applications include metal and woodworking machinery, grinders, power saws, conveyors, fans, pumps, blowers, textile and packaging machinery, and paper cutters.

Each switch is provided with magnetic trip elements which take the device off line when it senses current of 13 times the maximum switch rating.

**Class 11 - 3RV** manual starters can be used as Type E self-protected manual combination starters (up to 22 amps) per UL508 or as components in Group Installation per NEC 430.53. When using the Class 11 - 3RV as a manual combination starter upstream protection is not required.

**Class 11 - 3RV** controllers are available with low voltage protection which will automatically open the power poles when the voltage drops or the power is interrupted.

Controllers with the LVP option provide the OSHA requirements for protecting personnel from potential injury caused by the automatic start-up of machinery following a voltage drop or power interruption when low voltage protection is specified.

**Class 11 - 3RV** is available as Open style, or in NEMA 1, NEMA 7 & 9 or NEMA 7 & 9 / 3 & 4 enclosures.

Standard Features include:

- ON/OFF rotary handle with lockout and visible trip indication
- Adjustment dial for setting to motor FLA (Starters only)
- Low Voltage Protection (LVP) Option
- Short Circuit trip at 13 times the maximum setting of the FLA dial or rated current
- Ambient compensated up to 140°F
- Phase loss sensitivity
- Test trip function
- LVP Option Meets OSHA Requirements
- UL Listed
- CSA Certified

① Instantaneous Magnetic Trip will occur at 13 times the maximum FLA dial setting or rated switch current.  
 ② Product Category: IEC

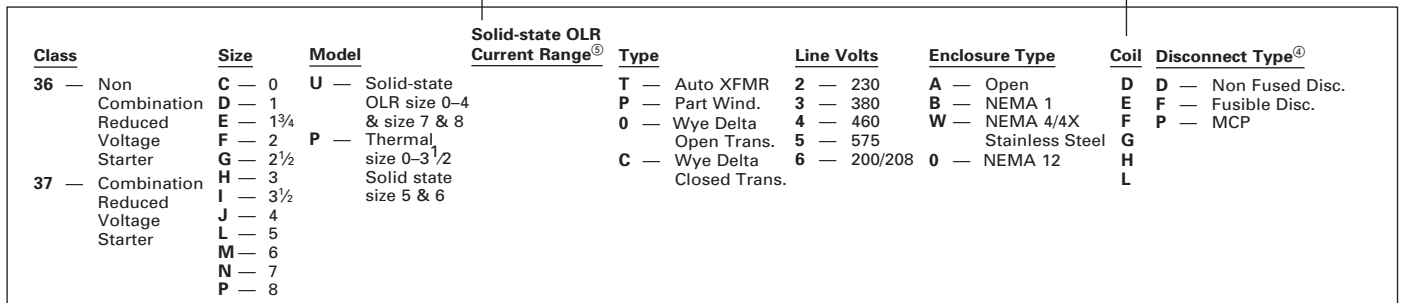

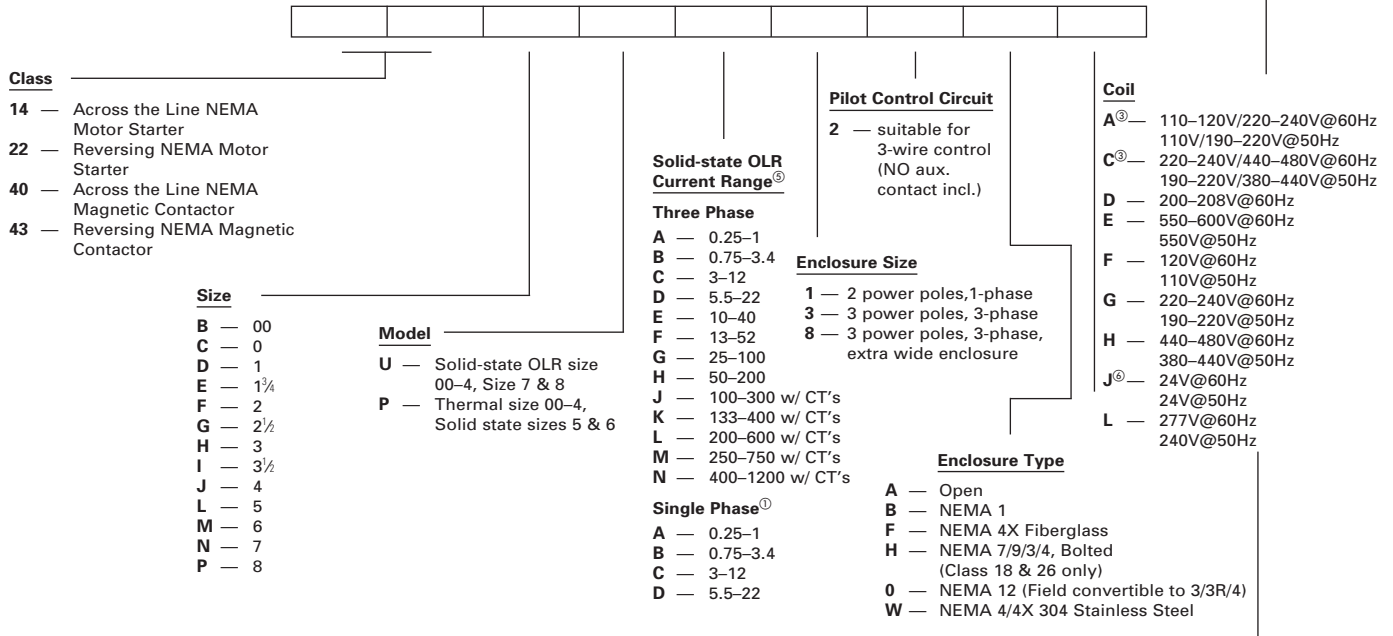

③ Shaded Ratings apply for Manual Motor Controllers Only! These Ratings do not apply as UL Listed Manual Combination Starters.

④ Add 1 to the end of the catalog number for 1/2 inch drain hole with plug and list price adder. Drain fitting not supplied, order separately XDB-2.

# Catalog Numbering System

## General

① Single phase solid-state OLR available on Class 14 Starters only.

② Not used on Class 17, 25 or with solid-state OLR versions.

③ Position used for solid-state OLR only.

④ Not available on sizes 5-8.

⑤ For Class 37 only.

## Features and Benefit

## General

Solid State Starter Class 14

## Standard Features

Size 00–4 magnetic starters include the following standard features:

- Rugged Industrial Design
- Half Sizes for Cost and Space Savings
- Dual Voltage, Dual Frequency Coils
- Solid State or Ambient Compensated Bimetal Overload Protection
- Wide Range of Accessories
- Easy Coil Access
- Overload Test Feature
- Straight Thru Wiring
- Gravity Dropout
- Large Silver Cadmium Contacts
- UL listed file #E14900 (class 14, 22, 30, 40 & 43)
- CSA certified file #LR 6535 (class 14, 22, 30, 40 & 43)

## Application

Heavy Duty starters are designed for across the line starting of single phase and polyphase motors.

These controls are available in NEMA Sizes 00 through 8. In addition to the usual NEMA Starter Sizes, Siemens offers three exclusive Half Sizes; 1¾, 2½ and 3½. These integral sizes offer the same rugged, industrial construction as our NEMA Sizes and ensure efficient operating performance. Half Sizes provide a real cost savings by cutting down on over capacity when NEMA Sizes exceed the motor ratings. All Siemens Heavy Duty controls, including our popular Half Sizes comply with applicable NEMA and UL tests.

All starters are supplied with a NO holding interlock that in conjunction with an appropriate pilot device will provide low voltage protection or release.

NEMA starters are ideal for applications requiring dependability and durability. Typical applications include use with machine tools, air conditioning equipment, material handling equipment, compressors, hoists and various production and industrial equipment as well as in demanding automotive applications.

Starters are available as an open type or in NEMA 1, 12/3/3R, 4 (painted), 4/4X (stainless), 4X (fiberglass), and 7 & 9 enclosures.

### Gravity Dropout

For added reliability, the gravity dropout of the armature and contacts is assisted by stainless steel springs which help provide quick, precise opening of the contacts.

### 45 Degree, Wedge Action Contacts

The 45 degree, wedge action contacts reduce tracking and provide faster arc quenching. The resulting self-cleaning and reduced contact bounce mean cooler operation and longer life for the large silver cadmium oxide contacts.

### Terminal Design

Control terminals are self-rising pressure type.

### Molded Coil

Magnetic coils are carefully wound and then sealed in epoxy. Encapsulation helps seal out moisture, promotes heat transfer and resists electrical, mechanical and thermal stresses.

### Dual Voltage/Frequency Coil

Starters are available with dual voltage, dual frequency coils. They are designed to operate on either 50 or 60 Hertz.

### Molded Stationary Contact Block

Thermoset materials resist arc tracking and the stresses of heat and severe impact.

### Field Modification Kits

All starters can be modified in the field with a complete range of accessories. These include pushbuttons, selector switches, pilot lights, auxiliary contacts and surge suppressors.

## Auxiliary Equipment

- NEMA starters are available with built-in START-STOP push buttons for 3-wire control or a HAND-OFF-AUTO selector switch for 2-wire control
- Field modifications such as auxiliary contacts, pilot lights, push buttons, selector switches, and fuse blocks are available to meet particular application requirements
- Normally opened or normally closed auxiliary power pole kits are available for Sizes 00 through 1¾
- Transformers can be ordered as either factory or field modifications. In some cases these may require a larger enclosure
- A full line of replacement parts are available including contact kits, coils, and overload relays

## Size 5 & 6 Starters Additional Features

- Solid State Overload (3RB type) Standard
- Latest technology in arc quenching to extend contactor life
- Wide variety of enclosures in all starter configurations

## Size 7 & 8 Starters Additional Features

- New Compact Design
- Can be mounted in any position
- Same coil voltage is AC or DC

# Features and Benefits

## Selection

ESP200™ Solid State Starter

ESP200™ starters combine the rugged NEMA contactors with a state of the art solid state overload that provides phase loss, phase unbalance ground fault protection. It offers the user greater motor protection and extended life in heavy duty applications. The ESP200™ ultimately results in a cost savings to the user.

### ESP200™ Solid State Overload Relays

Standard features provide Improved Starter Performance:

- True phase loss protection; trips within 3 seconds
- Phase unbalanced prevents motor running inefficiently
- Ground fault trip when selected
- Selectable trip class 5, 10, 20 or 30
- Reset trip can be selected Auto/Manual restart
- Easy to select and use, Dip Switch selectable
- Overload is self powered, no need for external power source

### Half Size Starters

Half-Size starters feature all the rugged performance characteristics of our NEMA rated starter sizes, but are fractionally sized to more closely match your exact motor rating. As a result, significant economic savings are made possible without sacrificing the reliability you expect from a heavy duty starter.

These additional starter sizes have the reserve capacity to handle occasional plugging and jogging applications without derating. Superior operating performance in heavy duty applications is assured by the large current carrying parts, not by derating the device.

Exclusive “half-sizes” save potentially hundreds, even thousands of dollars per project.

Using the table below, simply match the specific size starter to the horsepower rating of your motor. Every half-size starter saves you money—up to 31%.

All “half-sizes” comply to applicable NEMA and UL standards.

### ESP200® FLA Adjustment Dial—Set the adjustment dial on the overload to the FLA of the motor.

Typical Solid-State Overload Adjustment Dial Markings

Each overload is precisely calibrated and labels are laser printed.

### DIP Switch Settings

Adjust DIP switch settings to the Trip Class desired 5, 10, 20, or 30.

- Set Phase Unbalance ON or OFF
- Set Phase Loss ON or OFF
- Set Reset to Manual or Automatic
- Set Ground Fault ON or OFF

**Note:** Hp's shown above are based on the overload amp range for the FLA's (per the National Electric Code) of typical industrial motors. All Starter Sizes carry one maximum Hp rating. **For higher Hp single phase motors, use 3-phase starters, wire and set per diagram on page 9/173.**

ⓐ To receive a single phase starter in an extra wide enclosure, order the enclosure kit from pg 16-91 and the open style starter from pg 16-14 or 16-16 as separate items.  
 ⓑ For conduit hubs and conversion instructions, see page 9/110.

ⓒ Coils D, F, or G will be wired for incoming voltage. J coil will be wired for separate source. Coils E, H, and L do not apply to single phase starters.  
 ⓓ Standard Auxiliary Contacts, Same as Contactors, refer to page 9/60.

# Features and Benefits

## General

### Combination Starter Features

Combination starters include the following features:

- Manufactured with Cold Forming "TOX" Process
- Solid State Overloads Standard on Sizes 5-8
- Easy to Install
- Wide Range of Enclosure Types Available
- Heavy Duty Quarter Turns
- 100kA Short Circuit Current Rating when Protected with Class R Fuses to 600V or MCP to 480V
- Visible Blade Disconnect
- Industrial Type Disconnect Handle
- UL listed file #E185287 (class 17, 18, 25, 26 & 32)
- CSA certified file #LR 6535 (class 17, 18, 25, 26 & 32)

### Application

A combination starter meets National Electrical Code requirements for:

1. A means of providing short circuit motor protection with fused or breaker disconnection of line voltage.
2. A means of safeguarding personnel from contact with live parts and from accidental starting of machinery by disconnecting the motor and the controller.
3. A motor controller with overload protection.

Prewired combination starters eliminate the cost of wiring between separate disconnect and starter. Factory testing assures field performance. Combination starters also provide a more compact and attractive installation than separate units.

### Enclosure Types

Combination starters are available in NEMA 1, 12/3/3R/4 (painted), 4/4X

(stainless), 4X fiberglass and 7 & 9 enclosures. Enclosures protect personnel from contact with live parts and depending upon the construction, protect the control in varying degrees from physical damage and harmful atmospheres. All enclosures are supplied with corrosion resistant finishes.

### Heavy Duty Disconnect Switches

The disconnect switch that goes the distance in durability, performance and reliability has the following advantages:

- Visible blades for the highest level of safety
- Double break switching action to reduce arcing, increase lifetime and eliminate the "electric hinge"
- More rugged positive action switch
- Oversized lugs are standard
- Line side shield to help guard personnel from contact with live parts
- Higher horsepower rating for design E high efficiency motors
- UL listed for IlSCO, Burndy and T&B crimp type lugs
- The 200A switch accepts up to 300 MCM versus 250 MCM wire size

Its rugged construction - with a high fault withstand rating of 100kA at 600 VAC when fused with class R rated fuses - meets the most stringent industry standards set forth by the automotive, petro-chemical, and pulp and paper industries. UL recognized and CSA certified, our disconnect switches are available either non-fusible or fusible with class R and class J fuse clips.

### Enclosure Kits for NEMA Combination Starters Description

You can assemble a non-stocked combination starter per your unanticipated needs in minutes. Say, for example, your customer needs a fusible combination starter that you don't have in stock. You need in now, but don't sweat it.

Simply start with the enclosure kit which has the handle preinstalled. You install the required starter and fusible disconnect, connect the power wire and you are finished. Within minutes, you have the required combination starter in your hands. No more waiting on the factory. You need it, you got it!

### What Is In It For You!

- **Reduce Lead-time** - What used to take days to get now takes minutes
- **Reduced Inventory** - Instead of stocking scores of various combination starters, simply stock a few enclosure kits, disconnect kits, circuit breaker kits and open starters. With these basic "building blocks" you virtually have hundreds of products on-hand
- **Quality** - The same high level of quality you have been accustomed to with our products will also be found in these new enclosure kits
- **UL Listed** - By correctly following the instructions included with the kits, the product you build is UL/CSA Listed

Refer to page 9/115 for more details.

### Siemens Type ETI Circuit Breaker

The ETI circuit breaker is a device designed specifically for application in motor circuits. The ETI is a magnetic only protective device designed to provide protection against short circuit current.

The instantaneous-only type ETI circuit breaker employs adjustable magnetic trip settings to allow broader application ranges and a higher degree of motor short circuit protection.

### Heavy Duty Starters

These combination starters use the same starters described in the heavy duty starter section of this catalog.

# Non-Fusible with Solid State Overload, Class 17

Note: All starter sizes carry one maximum Hp rating (per the National Electric Code).

- Ⓣ Dual voltage coils not available in starter sizes 5–8.
- Ⓣ For conduit hubs and conversion instructions, see page 9/110.

- Ⓣ Use Class J fuses only.
- Ⓣ Enclosure is NEMA Type 4 (painted steel).
- Ⓣ Single phase wiring page 9/173.
- Ⓣ F coil 100–250V AC 50/60Hz, or DC, H coil 150–500V AC 50/60Hz, or DC

Ⓣ Only available  
F coil 100–250V AC 50/60Hz, or DC

# Fusible with Solid State Overload, Class 17

Note: Hp's shown above are based on the overload amp range for the FLA's (per the National Electric Code) of typical industrial motors. All starter sizes carry one maximum Hp rating.

① For conduit hubs and conversion instructions, see page 9/110.

② Single phase wiring page 9/173.

# MCP Type with Solid State Overload, Class 18

## Selection

### Ordering Information

- ▶ Replace the (\*) with a letter from the coil table. Dual voltage coils are wired on high voltage unless specified on order.
- ▶ Field Modification Kits see page 9/104.
- ▶ Factory Modifications see page 9/119.
- ▶ Dimensions see page 9/159.
- ▶ Wiring Diagrams see page 9/174.
- ▶ Replacement Parts see page 9/131.

### Coil Table

# MCP Type with Ambient Compensated Bimetal Overload, Class 18

## Selection

### Ordering Information

- ▶ Replace the (\*) with a letter from the coil table. Dual voltage coils are wired on high voltage unless specified on order.
- ▶ Heater elements see page 9/124. (3 required)
- ▶ Field Modification Kits see page 9/104.
- ▶ Factory Modifications see page 9/119.
- ▶ Dimensions see page 9/159.
- ▶ Wiring Diagrams see page 9/174.
- ▶ Replacement Parts see page 9/131.
- ▶ For NO/NC SPDT contact on overload relay, replace "81" with "91". "81" indicates one NC contact.

Note: Hp's shown above are based on the overload amp range for the FLA's (per the National Electric Code) of typical industrial motors. All starter sizes carry one maximum Hp rating.

Ⓞ For conduit hubs and conversion instructions, see page 9/110.

# Solid State Overload, Class 22

## Selection

### Ordering Information

- ▶ Replace the (\*) with a letter from the coil table. Dual voltage coils are wired on high voltage unless specified on order.
- ▶ Field Modification Kits see page 9/104.
- ▶ Factory Modifications see page 9/119.
- ▶ Dimensions see page 9/142 open and 9/162 enclosed.
- ▶ Wiring Diagrams see page 9/176.

### Coil Table

60Hz Voltage	Letter
24	J
120	F
110–120/220–240 <sup>Ⓛ</sup>	A
200–208	D
220–240	G
277	L
220–240/440–480 <sup>Ⓛ</sup>	C
440–480	H
575–600	E

For other voltages and frequencies, see Factory Modifications page 9/119.

## Selection

### Ordering Information

- ▶ Replace the (\*) with a letter from the coil table. Dual voltage coils are wired on high voltage unless specified on order.
- ▶ Heater elements see page 9/124.
- ▶ Fuse clips see page 9/120.
- ▶ Field Modification Kits see page 9/104.
- ▶ Factory Modifications see page 9/119.
- ▶ Dimensions see page 9/164.
- ▶ Wiring Diagrams see page 9/177.
- ▶ Replacement Parts see page 9/131.
- ▶ For NO/NC SPDT contact on overload, replace "81" with "91". "81" indicates one NC contact.

### Coil Table

60Hz Voltage	Letter
24	J
120	F
110-120/220-240 <sup>①</sup>	A
200-208	D
220-240	G
277	L
220-240/440-480 <sup>①</sup>	C
440-480	H
575-600	E

For other voltages and frequencies, see Factory Modifications page 9/119.

Note: All starter sizes carry one maximum Hp rating (per the National Electric Code).

① Dual voltage coils not available in starter sizes 5-8.

② For conduit hubs and conversion instructions, see page 9/110.

③ Enclosure is NEMA Type 4 (painted steel).

④ F coil 100-250V AC 50/60Hz, or DC, H coil 150-500V AC 50/60Hz, or DC

⑤ Only available F coil 100-250V AC 50/60Hz, or DC

# MCP Type, Class 26

## Selection

### Ordering Information

- ▶ Replace the (\*) with a letter from the coil table. Dual voltage coils are wired on high voltage unless specified on order.
- ▶ Field Modification Kits see page 9/104.
- ▶ Factory Modifications see page 9/119.
- ▶ Dimensions see page 9/164.
- ▶ Wiring Diagrams see page 9/177.
- ▶ Replacement Parts see page 9/131.
- ▶ For NO/NC SPDT contact on overload relay, replace "81" with "91". "81" indicates one NC contact.

F coil 100–250V AC 50/60Hz, or DC

## Features and Benefits

## General

## Features

- Rugged Industrial Design
- Dual Voltage, Dual Frequency Coils
- Compact Design
- Snap-On Front Removable Auxiliary Contacts
- Electrical and Mechanical Interlocks
- Half Sizes — Space and Cost Savings
- Industrial Type Disconnect Operating Handle
- Visible Blade Disconnect Thru Size 4
- Adjustable Motor Circuit Protector
- 100,000 Amp Fault Protection with MCP or Class R Fuses
- Pilot Device Locations identified on All Enclosures
- UL Listed File #E14900
- CSA Certified File #LR6535

## Applications

Multi-speed magnetic starters automatically reconnect multi-speed motor windings for the desired speed in response to a signal received from push button stations or other pilot devices.

These starters are available for two speed motors.

**Consequent Pole** multi-speed motors having two speeds on a single winding (consequent pole) require a starter which reconnects the motor leads to half the number of effective motor poles at the high speed point. In this type of motor, **the low speed is one half the high speed.**

**Separate Windings** motors having separate windings for each speed provide more varied speed combinations in that the low speed need not be one half the high speed.

**Starters for separate winding motors consist of a starter unit for each speed.**

Multi-speed motor starters are available for constant torque, variable torque and constant horsepower motors.

**Constant Torque** motors maintain constant torque at all speeds. Horsepower varies directly with speed. This type of motor is applicable to conveyors, mills and similar applications.

**Variable Torque** motors produce a torque characteristic which varies as the square of the speed. This type of

motor is applicable to fans, blowers and centrifugal pumps.

**Constant Horsepower** motors maintain constant horsepower at all speeds and therefore torque varies inversely with speed. This type of motor is applicable where the same horsepower is required at all speeds. **The higher current required at low speed requires derating on starters for constant horsepower applications.** This type of motor is applicable to metal working machines such as drills, lathes, mills, bending machines, punch presses, and power wrenches.

**Operation**

Magnetic starters for multi-speed applications select the desired speed in accordance with the pilot control.

The shock to machinery upon the reduction of speed is greater than when the speed is increased. Therefore, the pilot control should be wired so that the stop button must be depressed before dropping to a lower speed or time delays should be used for applications requiring full automatic operations. The multi-speed controls are available with the necessary interlocks or relays to provide this type of operation.

These controls may be modified for compelling or acceleration pilot control.

**Selective Control** permits the operator to start the motor at any speed and to change to a higher speed by merely pushing a button. To change to a lower speed it is necessary to first depress the stop button and to then press the proper speed button. Selective control is a function of the pilot control selected and requires no starter modifications.

**Compelling Control** requires that the motor always be started at the lower speed and that the push buttons be operated in speed sequence to go to the next higher speed. To change to a lower speed, the stop button must be depressed and then the push buttons operated in speed sequence until the desired speed is reached. Compelling control can be added from the factory modification section page 9/122.

**Acceleration Control** provides that the motor be accelerated automatically with timers by progressively energizing the controls from the push button station from the lowest to highest speed. To change to a lower speed the stop button is depressed and then it is necessary to proceed as if starting from rest. Acceleration control can be added from the factory modification section page 9/122.

**Deceleration Control** provides that the motor be decelerated automatically with a timer when going from high speed to low speed. The timer allows the motor to decelerate from high speed to a lower speed before automatically restarting the motor in low speed. Deceleration control can be added from the factory modification section page 9/122.

Open Style Two Speed Starter  
(ESP100 Overload)

Open Style Two Speed Starter

Note: All starter sizes carry one maximum Hp rating (per the National Electric Code).

① Dual voltage coils not available in modified starters.

② For conduit hubs and conversion instructions, see page 9/110.

③ If motor FLA are unknown, select overload on the basis that low speed FLA will be no greater than 50% of high speed FLA.

# MCP Type, Constant Horsepower with Solid State Overload, Class 32

Note: All starter sizes carry one maximum Hp rating (per the National Electric Code).

ⓐ Dual voltage coils not available in modified starters.

ⓑ For conduit hubs and conversion instructions, see page 9/110.

ⓐ First † for high speed, second † for low speed. Use motor nameplate information to select FLA. If motor FLA are unknown, select overload on the basis that low speed FLA will be no greater than 50% of high speed FLA.

Selection

Ordering Information

- ▶ Replace the (\*) with a letter from the coil table. Dual voltage coils are wired on high voltage unless specified on order.
- ▶ Heater elements see page 9/124. (6 Required)
- ▶ Field Modification Kits see page 9/104.
- ▶ Factory Modifications see page 9/119.
- ▶ Dimensions see page 9/166.
- ▶ Wiring Diagrams see page 9/178.
- ▶ Replacement Parts see page 9/131.
- ▶ For NO/NC SPDT contact on overload relay, replace "81" with "91". "81" indicates one NC contact.

Note: Hp's shown above are based on the overload amp range for the FLA's (per the National Electric Code) of typical industrial motors. All starter sizes carry one maximum Hp rating.

① Dual voltage coils not available in modified starters.

② For conduit hubs and conversion instructions, see page 9/110.

# Features and Benefits

## General

Siemens manufactures the three commonly used electromechanical reduced voltage starters. Each one is designed for specific application requirements and consists of auto transformer, wye-delta and partwinding starters.

The reduced voltage starter:

- Reduces inrush current
- Provides smoother acceleration of the load
- Reduces starting torque
- Reduces stresses on mechanical linkages

Combination and non-combination reduced voltage starter sizes range from 0 to 6 including Siemens exclusive motormatched half-sizes. Enclosure types include 1, 3R/12, 4 painted and 4/4X stainless steel. UL listed file #E14900 (class 36); file #E185287 (class 37). CSA certified file #LR 6535 (class 36 & 37).

### Auto Transformer Starter

- Maximum torque per amp
- Three coil auto transformer for balanced starting currents
- 50, 65 and 80% voltage taps
- Closed circuit transition
- Adjustable starting time
- Solid-state OLR overload as standard
- CPT supplied as standard
- Wide range of factory modifications

### Wye-Delta Starter

- Lowest starting torque
- Closed or open circuit transition
- Adjustable starting time
- Solid-state OLR overload as standard
- CPT supplied as standard
- Wide range of factory modifications

### Part-Winding Starter

- Simplest design – most economical
- Adjustable starting time
- Solid-state OLR overload as standard
- CPT supplied as standard
- Wide range of factory modifications

## Various Methods of Electro-Mechanical Reduced Voltage Motor Starting —A General Comparison

Characteristic	Autotransformer			Part-Winding 2 step	Wye-Delta
	50% Tap	65% Tap	80% Tap		
Starting current drawn from line as % of that which would be drawn upon full voltage starting	25%	42%	64%	65%	33%
Starting current drawn by the motor	50%	65%	80%	65%	58%
Starting torque developed as % of that which would be developed on full voltage starting	25%	42%	64%	40%	33%
Smoothness of acceleration	First in order of Smoothness			Third in order of Smoothness	Second in order of Smoothness
Allowable accelerating times (typical)	15 seconds at 200HP max. or 30 seconds on 200HP based on NEMA medium duty transformers			5 seconds max. Limited by motor design	5-60 seconds Limited by motor design
Starting current and torque and adjustments	Adjustable within limits of various taps			Fixed	Fixed

# Auto Transformer with Solid State Overload, Class 36 & 37

## Selection

	<b>Ordering Information</b> <ul style="list-style-type: none"> <li>▶ Field Modification Kits see page 9/104.</li> <li>▶ Factory Modifications see page 9/119.</li> <li>▶ Dimensions see page 9/167.</li> <li>▶ Wiring Diagrams see page 9/181.</li> <li>▶ Replacement Parts see page 9/131.</li> </ul>	<b>Coil and Control Voltage</b> <p>The coil voltage will always match the motor voltage. As standard, a CPT is supplied and 120V control voltage is utilized. To change to 120V voltage (CPT not supplied), change the 9th character to "F". To change to 24VAC voltage (CPT not supplied), change the 9th character to "J".</p>

Note: All starter sizes carry one maximum Hp rating (per the National Electric Code).

① See page 9/110 for conduit hubs and conversion instructions.

# 2 Step Part Winding with Solid State Overload, Class 36 & 37

## Selection

	Ordering Information	Coil and Control Voltage
	<ul style="list-style-type: none"> <li>▶ Field Modification Kits see page 9/104.</li> <li>▶ Factory Modifications see page 9/119.</li> <li>▶ Dimensions see page page 9/167.</li> <li>▶ Wiring Diagrams see page 9/180.</li> <li>▶ Replacement Parts see page 9/131.</li> </ul>	<p>The coil voltage will always match the motor voltage. As standard, a CPT is supplied and 120V control voltage is utilized. To change to 120V voltage (CPT not supplied), change the 9th character to "F". To change to 24VAC voltage (CPT not supplied), change the 9th character to "J".</p>
