Siemens aims to achieve double-digit annual growth in digital businesses

- Software, digital services and platforms as growth drivers
- MindSphere cloud-based, open IoT operating system rolled out companywide
- Cooperation with IBM: IBM Watson Analytics to be integrated into MindSphere
- R&D investments rise to over €5 billion

Siemens wants to further strengthen its position as a digital company and achieve double-digit growth in software, digital services and cloud platforms every year through 2020. In fiscal 2016, Siemens generated revenue of more than €1 billion with digital services and around €3.3 billion with software solutions, an increase year-over-year of around 12 percent, which is considerably above annual market growth of some eight percent.

The new MindSphere cloud platform, which Siemens is now rolling out companywide, will also be a growth driver. It will enable Siemens for the first time to offer customers in sectors ranging from industry to rail operation a cloud-based, open operating system for the Internet of Things. It will also make it possible to develop and operate apps and digital services. To take just one example: the immense data volumes generated at a production facility or a company can be swiftly and efficiently collected, evaluated and utilized to improve, for instance, system performance and availability. The new technology also helps customers evaluate and leverage data to achieve new insights. For example, it paves the way for completely new business models such as the sale of machine hours.

“The digitalization platform MindSphere is a key element in our Vision 2020’s innovation strategy. It’ll enable us to decisively shape digitalization at our customers
and at our own facilities – across all sectors and businesses,” said Joe Kaeser, Siemens President and CEO.

To further strengthen its power of innovation, Siemens is planning to increase its investments in research and development (R&D) in fiscal 2017 by some €300 million to around €5 billion. Since fiscal 2014, the company’s R&D investments have grown by about 25 percent. A major part of these additional funds are earmarked for automation, digitalization, decentralized energy systems and the new venturing unit next47. Research intensity, which equals the ratio of R&D expenditures to revenue, was 5.9 percent in fiscal 2016. This figure will further increase in fiscal 2017.

Siemens is working with IBM to further simplify the data analysis functions of MindSphere for customers. The companies are planning to integrate the data analysis service IBM Watson Analytics and further analysis tools into MindSphere. This is designed to give business customers access to visualization functions and dashboards, while app developers and data analysts will be able to use analytics technologies via interfaces. IBM is also planning to develop apps for MindSphere – for example in the area of predictive maintenance. IBM and Siemens want to bundle their respective competences – in the area of efficient analysis technologies and the automation and digitalization of industry. In this way the two companies want to assist their customers on their way to digitalization.

Siemens has also improved in the area of patents. As of September 30, 2016, the company’s continuing operations held some 59,800 patents worldwide. At the end of fiscal 2015, the figure was 56,200. In fiscal 2016, Siemens employees submitted about 7,500 invention disclosures – an average of about 30 per workday. The number of R&D employees at the company averaged 33,000 in fiscal 2016 – about 800 more than in the previous year.

Siemens AG (Berlin and Munich) is a global technology powerhouse that has stood for engineering excellence, innovation, quality, reliability and internationality for more than 165 years. The company is active in more than 200 countries, focusing on the areas of electrification, automation and digitalization. One of the world’s largest producers of energy-efficient, resource-saving technologies, Siemens is a leading supplier of efficient power generation and power transmission solutions and a pioneer in infrastructure solutions as well as automation, drive and software solutions for industry. The company is also a leading provider of medical imaging equipment – such as computed tomography and magnetic resonance imaging systems – and a leader in laboratory diagnostics as well as clinical IT. In fiscal 2016, which ended on September 30, 2016, Siemens generated revenue of €79.6 billion and net income of €5.6 billion. At the end of September 2016, the company had around 351,000 employees worldwide.
