Wildfires are becoming more frequent, covering larger areas, and causing more damage. Overhead power lines are subject to natural events, human activities, and aging, threatening lives and property, in the Amazon as well as in the U.S. New electrical infrastructure, such as new substations and transformers, as well as distribution systems, generates fuel for wildfires. Poor equipment maintenance, severe weather patterns, and rising temperatures are increasing the risk of forest fires igniting. Siemens solutions help mitigate wildfire risk.
